MEWA VANGUARD BUSINESS SCHOOL

Bengaluru City University

2023-2025

DECLARATION BY THE STUDENT

I hereby declare that—**DECODING DIGITAL CAMPAIGNS: BUSINESS INSIGHTS THROUGH POWER-BI AT CLOUD SYNERGY, BENGALURU** is the result of the project work carried out by me under the guidance of **Dr. PADMA C** in partial fulfillment for the award of Master's Degree in Business Administration by Bengaluru City University.

I also declare that this Master Thesis is the outcome of my own efforts and that it has not been submitted to any other university or Institute for the award of any other degree or Diploma or Certificate.

Place: Bangalore **Name: MUHAMMED SALMANUL FARIS K T**

Date: **Register Number: P18EP23M015063**

GUIDE CERTIFICATE

This is to certify that the Business Plan Report **"DECODING DIGITAL CAMPAIGNS: BUSINESS INSIGHTS THROUGH POWER-BI AT CLOUD SYNERGY, BENGALURU".** Submitted by **MUHAMMED SALMANUL FARIS K T**, Reg No. **P18EP23M015063** To Bengaluru City University, Bengaluru for the award of Degree of Master of Business Administration is a record of work carried out by her under my guidance.

Place: Bangalore

Date: **Signature**

MEWA
VANGUARD
BUSINESS SCHOOL
(Affiliated to Bengaluru City University & Approved by AICTE)

Ref. Date:.....

Date: 30-10-2025

CERTIFICATE OF ORIGINALITY

This is to certify that the Master thesis tilted "**Decoding Digital Campaigns: Business Insights Through Power-BI at Cloud Synergy, Bengaluru.**" is an original work of **Mr. Muhammed Salmanul Faris K T** bearing University Register Number **P18EP23M015063**and is being submitted in partial fulfillment for the award of the Master's Degree in Business Administration of Bengaluru City University. The report has not been submitted earlier either to this University /Institution for the fulfillment of the requirement of a course of study. Mr. Muhammed Salmanul Faris K T is guided by **Dr. Padma C** is the Faculty Guide as per the regulations of Bengaluru City University. The plagiarism check is performed in **Turnitin Software.** The Similarity Index **percentage is 2%,** and there is no similarity for Artificial Intelligence or Generative Artificial Intelligence Index Tools.

DIRECTOR
Director
MEWA Vanguard Business School
128,38th Cross, East End Main Road,
Jayanagar 9th Block, Bangalore - 560 069.

ACKNOWLEDGEMENT

Any achievement, be it scholastic or otherwise does not depend solely on the individual efforts but on the guidance, encouragement and cooperation of intellectuals, elders, and friends. A number of personalities, in their own capacities have helped me in carrying out this project work. I would like to take this opportunity to thank them all.

I extend my sincere thanks to Director **Dr. Anilkumar S,** for providing me with the opportunity to undertake this internship. Your vision and commitment to experiential learning have been a driving force behind this enriching experience and your constant encouragement and insightful feedback. Your mentorship has been instrumental in shaping my perspective and approach towards this project.

I would like to express my appreciation to Principal **Dr. Bharathish Rao R S**, for your unwavering support and belief in the potential of internships as a vital aspect of our education. Your guidance has been a source of motivation for me.

Additionally, I would like to take this opportunity to thank **Dr. Padma C** Research Coordinator & Associate Professor, Vanguard Business School, for providing me with the chance to work on this project and for her insightful advice throughout its various stages of development, which helped me optimize the report and ensure the project's success.

I would also like to take this opportunity to express my sincere gratitude to **Dr. Padma C** for giving me the opportunity to undertake this project and giving me valuable guidance during the various stages of development of this project and in optimizing the report and making this project a success.

Lastly, I would like to thank all the individuals who have directly or indirectly contributed to this dissertation project. Your collective efforts have played a significant role in shaping this experience.

Thanking you,

MUHAMMED SALMANUL FARIS K T

Reg No: P18EP23M015063

REF: CSS/INT/2025/103 1st October 2025

RESEARCH-BASED INTERNSHIP COMPLETION CERTIFICATE

TThis is to certify that **Mr. Muhammed Salmanul Faris K.T, Reg No: P18EP23M015063** a student of **MBA (Business Analytics and Marketing)** at **Mewa Vanguard Business School, affiliated to Bengaluru City University,** has successfully completed his **research-based internship** at **Cloud Synergy Pvt. Ltd**., Bengaluru. His internship was undertaken from **21st July 2025 to 22nd September 2025**, for a duration of **45 working days**.

During this period, he carried out a research project titled:
"Decoding Digital Campaigns: Business Insights through Power BI at Cloud Synergy"

Throughout his internship, **Mr. Muhammed Salmanul Faris K.T** demonstrated excellent analytical ability, dedication, and professionalism. He actively engaged in data analysis, digital performance evaluation, and dashboard creation using **Power BI** to derive actionable business insights. His contribution was highly appreciated, and his research has provided valuable insights supporting Cloud Synergy's digital analytics and business intelligence initiatives.

We wish **Mr. Muhammed Salmanul Faris K.T** all success in his academic and professional career.

For and behalf of Cloud Synergy Solutions Pvt

Mr. Manoj
Senior Business Analyst
Cloud Synergy Pvt Ltd

ABSTRACT

The efficacy of digital marketing campaigns in the field of education technology is examined in this research project, "Decoding Digital Campaigns: Business Insights through Power BI at Cloud Synergy, Bengaluru." Over the course of three months, the study uses Microsoft Power BI to examine campaign data from Facebook, Instagram, LinkedIn, YouTube, Google Ads, and email. Dynamic dashboards and visual analytics are used to analyse key performance metrics like leads, sign-ups, conversions, cost per lead, and return on ad spend (ROAS). High-performing platforms, conversion flow bottlenecks, and device and geographic user behaviour are all identified in the study, which also offers data-driven tactics for maximising marketing expenditures and boosting enrolment. The gaps in data-driven marketing analytics in educational settings are filled in part by this work.

This study offers a multifaceted assessment of digital marketing campaigns using both quantitative and qualitative data analysis techniques. The study uncovers complex user behaviours and platform-specific dynamics that are frequently missed by conventional reporting tools by utilising Power BI's sophisticated visualisation features. The results emphasise the strategic value of real-time business intelligence in educational decision-making processes, in addition to providing actionable insights for maximising advertising spend. By enabling data-driven marketing strategies that enhance enrolment outcomes and optimise return on investment, this thorough analysis helps Cloud Synergy adjust to competitive market conditions.

CHAPTER 1

INTRODUCTION

1.1 Overview of the Topic.

Businesses are using digital marketing campaigns more and more to reach, interact with, and convert potential customers in today's fiercely competitive digital environment. In order to generate leads and produce quantifiable results, these campaigns combine a number of online channels, including YouTube, Email, Google Ads, Facebook, Instagram, and LinkedIn. However, an organization's capacity to effectively track, analyse, and optimise marketing data determines how successful such campaigns are.

As business intelligence (BI) technologies have advanced, companies can now turn unprocessed marketing data into insights that can be put to use. One of the top BI tools, Power BI, lets marketers and data analysts visualise campaign performance, examine important metrics, and make data-driven decisions instantly.

In order to gain insights on lead generation, ad performance, and conversion behaviour, the research project "Decoding Digital Campaigns: Business Insights Through Power BI at Cloud Synergy, Bengaluru" uses Power BI to analyse data from digital campaigns. Additionally, the project seeks to comprehend how user journeys change from ad clicks to final enrolments, as well as which online platforms are most effective at producing leads and sign-ups.

1.1.1 Importance of Digital Campaigns in Modern Business Environment.

Digital campaigns are now the cornerstone of contemporary marketing plans. They offer quantifiable information on ROI, conversion rates, and audience engagement. Nowadays, companies use data-driven digital marketing to precisely target audiences and assess results in real time, rather than depending only on traditional advertising techniques.

Businesses can find high-performing platforms, allocate marketing budgets more effectively, and customise customer communications with the help of effective campaign management. Additionally, it offers a more thorough comprehension of consumer behaviour patterns, which aids marketers in honing their tactics for optimal effect.

For organizations like Cloud Synergy, which primarily operate in the education and technology training sector, digital marketing campaigns play a crucial role in attracting students, professionals, and corporate clients seeking to enhance their skills.

1.1.2 Role of Business Intelligence (BI) in Digital Marketing.

The technology-driven process of evaluating data to aid in business decision-making is known as business intelligence (BI). BI tools are used in digital marketing to help marketers find hidden patterns and assess the success of campaigns. BI dashboards offer a consolidated view of marketing performance by integrating data from various digital platforms, including YouTube, Email, Google Ads, Facebook, Instagram, and LinkedIn.

Campaign analysts can monitor metrics such as return on ad spend (ROAS), customer acquisition cost (CAC), lead quality, click-through rate (CTR), and conversion rate with the help of business intelligence (BI). Understanding which channels function best and which areas require optimisation is made easier by the insights obtained.

Marketing managers can also use BI to visualise the customer journey from initial engagement to conversion, which enables data-driven adjustments to budget allocation, ad creatives, and targeting strategies.

1.1.3 Introduction to Power BI as an Analytical Tool.

Microsoft created Power BI, a business analytics tool that enables users to share insights, visualise data, and make well-informed decisions. It offers robust Data Analysis Expressions (DAX) for calculations and dynamic report creation, interactive dashboards, and real-time data connections.

Data from multiple digital campaigns run by Cloud Synergy across platforms like YouTube, Email, Google Ads, Facebook, Instagram, and LinkedIn was consolidated for this project using Power BI. The instrument played a key role in:

- Determining which platforms produced the greatest number of sign-ups and leads.

- Assessing the effectiveness of various ad formats.
- Examining the conversion process from the initial ad click to the final enrolment.
- Establishing KPIs like ROAS, Conversion Rate, Total Spend, and Total Revenue.

Through Power BI visualizations, Cloud Synergy gained a clearer understanding of how digital marketing strategies translate into tangible results, enabling more data-driven decision-making.

1.2 Theoretical Background of the Study.

At the nexus of business intelligence and marketing analytics is marketing performance analysis. To increase its efficacy and optimise return on investment, marketing performance must be systematically measured, managed, and analysed.

Effective marketing, according to Philip Kotler, the father of modern marketing, entails comprehending consumer needs, creating value-driven campaigns, and regularly assessing results. From straightforward descriptive reporting to predictive and prescriptive analysis utilising data visualisation, machine learning, and real-time dashboards, marketing analytics has changed with the rise of digitalisation.

The technologies and procedures used in this study to convert unprocessed data into useful insights for business decisions are referred to as business intelligence (BI). With the help of Microsoft's Power BI, users can visualise marketing performance through dynamic dashboards that integrate datasets from various sources. With BI, marketers can:

- Use metrics like Return on Advertising Spend (ROAS) and Cost per Lead (CPL) to gauge the effectiveness of your campaigns.
- Recognise how customers interact with various platforms.
- Determine which cities or populations are performing well.
- Make the most of your marketing budget with insights supported by data.

This study's foundation is the integration of data analytics frameworks and marketing theory, which shows how analytics turns marketing intuition into quantifiable results.

1.3 Explanation for related concepts of selected research.

1.3.1 Marketing Analytics.

Utilising data and technology, marketing analytics assesses marketing performance, finds trends, and predicts future developments. It enables businesses to comprehend how various platforms (like social media, email campaigns, and Google Ads) support overarching marketing objectives.

Cloud Synergy can use analytics to determine which campaigns result in higher conversion rates, which cities produce more leads, and how to optimise ad budgets to increase return on assets.

1.3.2 Return on Advertising Spend (ROAS).

According to this study's ROAS of ₹22.82, Cloud Synergy made ₹22.82 for every ₹1 invested in digital advertising. This indicates successful targeting and content strategies and shows a high level of campaign efficiency.

1.3.3 Business Intelligence (BI) and Power BI.

Business Intelligence tools transform raw marketing data into visual insights. Power BI enables users to create interactive dashboards using metrics like leads, conversion rates, and regional performance. In this study, Power BI is used to:

- Combine campaign information from several platforms.
- To compute KPIs like ROAS and conversion rate, use DAX formulas.
- Use charts such as pie charts, line charts, and bar graphs to visualise the results.

1.3.4 Data Visualization.

Data visualisation makes complex insights easily comprehensible at a glance by presenting data graphically. Maps, graphs, and charts are essential for spotting trends

like the city with the most leads or the month with the highest engagement. The interpretation of performance trends for August–October 2025 in this project heavily relies on visualisation.

1.3.5 Lead Generation and Conversion.

In marketing, a lead refers to a potential customer who has shown interest in a product or service. The number of leads that eventually register or make a purchase is measured by the conversion rate. Cloud Synergy generated 12,000 leads and converted 4,284 into sign-ups, representing a strong conversion performance.

1.3.6 Digital Campaign Metrics.

Among the crucial campaign metrics are:

- Total Leads: the quantity of interested people brought about by advertisements.
- Those who signed up for a course are known as sign-ups.
- Ad effectiveness is measured by the Click-through Rate (CTR).
- Cost efficiency is determined by cost per lead (CPL).

These metrics offer a quantitative basis for decision-making and are displayed in Power BI.

1.3.7 Role of Analytics in Education Marketing.

The education industry has witnessed significant competition in recent years. Analytics are now used by institutions to comprehend digital engagement, course demand, and student preferences. Analytics are used by Cloud Synergy to determine which cities have higher demand for courses.

1.3.8 Purpose of the Study.

This study's main goal is to use Power BI to evaluate Cloud Synergy's digital marketing performance in order to extract useful information that can improve strategic planning and marketing efficacy. In order to facilitate evidence-based

decision-making, the study attempts to convert marketing data into useful business intelligence.

Important goals include:

- Assess Cloud Synergy's digital campaigns' performance in terms of leads, sign-ups, and return on ad spend in order to determine the effectiveness of the campaigns.
- To illustrate data-driven marketing, highlight how analytics programs such as Power BI can transform intricate marketing data into clear visual insights that managers can use to make decisions.
- To Determine Trends by City and Month:
- Find out which months and places attracted the most prospective students.
- To Increase Marketing ROI: Offer Cloud Synergy information that will help them better target their ads, optimise future spending, and increase ROI.
- To close the gap between data and decision-making, promote an organisational culture that is data-driven and where strategic decisions are made based on facts rather than gut feelings

1.4 Summary.

The study's foundation was presented in this chapter, which also highlighted the growing significance of business intelligence and marketing analytics in contemporary organisations. It gave a summary of Cloud Synergy's marketing initiatives, business plan, and the rationale behind performing a performance analysis using Power BI. The connection between marketing theory and analytical practice was made possible by theoretical revelations and associated ideas.

1.5 Conclusion.

The study's first chapter emphasises the growing significance of business intelligence and digital marketing in the cutthroat business world of today. It focusses on Cloud Synergy's use of Power BI to examine campaigns on Facebook, Instagram, LinkedIn, YouTube, and Google Ads. It highlights how integrating BI tools makes it possible to

track and optimise marketing efforts precisely, which improves lead generation, conversions, and return on ad spend. The chapter lays out the theoretical underpinnings, goals, and scope of the study, emphasising the necessity of a data-driven methodology that converts marketing data into useful insights to enhance strategic planning and decision-making in education marketing.

CHAPTER 2

ORGANIZATIONAL PROFILE

2.1 Introduction to the Organization.

With its headquarters located in Bengaluru, Karnataka, India, Cloud Synergy is a renowned professional learning and certification organisation. Cloud Synergy was founded with the goal of bridging the gap between academic learning and industry demands, and it has since become a reputable location for corporate skill development and technology-oriented education.

The organization's main goal is to provide working professionals and students with advanced knowledge in data analytics, cloud computing, networking, and SAP (Systems, Applications, and Products). In order to serve a varied student body throughout India, it has extended its reach over time to several cities, including Hyderabad, Delhi, Chennai, Kochi, and Mumbai.

Cloud Synergy is distinguished by its industry-integrated curriculum, learner-centric approach, and hands-on training methodology. The institution guarantees that each student acquires the skills necessary to prosper in the digital economy by fusing theoretical ideas with practical applications.

Cloud Synergy is a perfect organisation for evaluating the effectiveness of digital marketing in the context of this study. To draw students to its certification programs, the

organisation mainly uses digital marketing. Knowing which campaigns produce the most leads, conversions, and returns gives educational institutions important information about how to use analytics to improve marketing results.

2.2 Company Profile.

Name of the Organization	Cloud Synergy
Headquarters	Bengaluru, Karnataka, India
Branches	Hyderabad, Delhi, Chennai, Kochi, and Mumbai
Industry	Education Technology (EdTech) and Professional Training
Nature of Business	Professional Training and Certification
Mode of Operation	Hybrid Learning (Online and Classroom-based)
Target Audience	Students, Working Professionals, and Corporate Clients
Core Competencies	SAP Training, Cloud Computing, Data Analytics, and Networking
Training Platforms	Physical Classrooms, Online Live Sessions, and E-learning Portals
Analytical Tools Used	Power BI, Excel, MySQL, Tableau, and Python

Table No: 2.1

The business strategy of Cloud Synergy combines technology, analytics, and education. It offers learners both fundamental knowledge and practical project experience through its extensive programs, which are delivered by knowledgeable instructors and professionals in the field.

Three main pillars support its reputation in the training industry:

- Professionals with certification provide high-quality instruction.

- Emphasise case studies, real-world projects, and simulations for hands-on learning.
- Career Support: Advice on opportunities for certification and placement.

The digital sphere is crucial to Cloud Synergy's marketing success because search engines, social media, and paid advertising campaigns are the primary enrolment drivers. Because of this, the business is a great case study for researching data-driven marketing analytics.

2.3 Product and Service Profile.

A wide variety of professional training programs are available from Cloud Synergy, catering to the requirements of both novices and seasoned professionals. Three main verticals can be used to classify its services:

2.3.1 SAP Training Programs.

The SAP (Systems Applications and Products) training courses offered by Cloud Synergy are its most well-known offerings. These are organised into different modules that serve both technical and functional domains:

- SAP FICO (Finance and Controlling)
- SAP MM (Materials Management)
- SAP ABAP (Advanced Business Application Programming)
- SAP HR/HCM (Human Resources / Human Capital Management)
- SAP S4 HANA (High-Performance Analytics)

These courses are made to satisfy the changing needs of international industries while preparing students for SAP certification exams.

2.3.2 Cloud Computing and Networking Programs.

Cloud technologies, which are highly sought after in IT and enterprise ecosystems, are the main focus of Cloud Synergy.

Important products include:

- AWS (Amazon Web Services)
- Microsoft Azure
- Linux Administration

- CCNA (Cisco Certified Network Associate)

These courses are designed for IT workers who want to improve their networking and infrastructure abilities in cloud-based settings.

2.3.3 Data Analytics and Business Intelligence Programs.

Cloud Synergy offers thorough courses in analytics and visualisation tools like these because it recognises the growing significance of data-driven decision-making.

- Excel (Advanced)
- Power BI
- MySQL
- Python for Data Analysis
- Tableau (Visualization Tool)

By including these analytics tools, students are able to create dashboards, evaluate business data, and decipher insights for use in organisational decision-making.

2.3.4 Additional Services.

- Corporate Training Programs: Tailored upskilling courses for businesses.
- Career support includes help with placement, interview preparation, and resume building.
- Project-Based Learning: Practical exercises and real-time simulation projects.
- Certifications: Support for international SAP, AWS, and Microsoft certification tests.

Cloud Synergy prepares students to adjust to technological changes in their workplaces by aligning its services with the demands of a data-centric business environment through these offerings.

2.4 McKinsey's 7-S Framework.

A strategic management tool for assessing the internal coherence and efficacy of an organisation is the McKinsey 7-S Framework. It looks at the following seven

interconnected components that make up an effective organisation: strategy, structure, systems, shared values, style, staff, and skills.

This framework offers a comprehensive understanding of how Cloud Synergy's internal components cooperate to fulfil its goals.

2.4.1 Strategy.

The main goal of Cloud Synergy's strategy is to offer career-focused training courses that combine business, analytics, and technology. To draw in students from all over the country, its marketing approach mainly uses digital campaigns on social media and search engines.

By employing tools like Power BI to gauge the success of campaigns and pinpoint lucrative client segments, the organisation also places a strong emphasis on data-driven marketing. The following are the organization's top strategic priorities:

- Increasing its presence in Tier-1 and Tier-2 cities.
- Enhancing collaborations with tech companies such as AWS and SAP.
- Utilising digital marketing analytics to increase brand awareness.

2.4.2 Structure.

Cloud Synergy has a well-functioning organisational structure. It is separated into divisions like Student Relations, Technical Support, Marketing and Sales, and Training and Academics. Reporting hierarchies are maintained for coordination, and each department has distinct roles.

Effective execution of academic and promotional activities is ensured by this structure, which permits specialisation and facilitates communication between management, trainers, and marketing teams.

2.4.3 Systems.

The company operates using both automated and manual systems. Important systems consist of:

- Learning Management System (LMS): For feedback, tests, and online courses.
- CRM: For monitoring student records, leads, and sign-ups.
- Power BI analytics dashboards: For tracking the effectiveness of marketing campaigns.
- Payment gateways: Used to handle enrolments and course fees.

These systems guarantee efficiency, accountability, and transparency in marketing and academic operations.

2.4.4 Shared Values.

Integrity, excellence, innovation, and continuous learning are Cloud Synergy's core shared values.

These principles serve as a roadmap for administrators, students, and trainers to maintain professionalism and quality in all facets of service delivery and training. High course completion rates and steady student satisfaction are indicators of the organization's dedication to excellence.

2.4.5 Style.

At Cloud Synergy, the leadership style is learner-focused and participatory. In order to promote a culture of cooperation and candid communication, management welcomes input from instructors and students. Data-driven and student-focused decisions are made, especially when developing courses and marketing campaigns.

2.4.6 Staff.

A group of certified instructors, technical specialists, and support personnel with extensive industry experience work for Cloud Synergy. Trainers are frequently qualified experts who infuse the classroom with real-world knowledge. To stay current with the newest developments in cloud computing, SAP, and analytics, the employees participate in frequent upskilling programs.

2.4.7 Skills.

The following are the primary competencies that characterise Cloud Synergy's competitive edge:

- Technical Proficiency: Knowledge of data analytics, cloud computing, and SAP.
- Analytical Capability: Expert use of data visualisation tools like Excel, MySQL, and Power BI.
- Marketing Skills: Expertise in ROI analysis and digital campaign management.
- The capacity to develop dynamic and captivating educational materials is known as instructional design.

Together, these abilities support the organization's long-term success in a cutthroat academic setting.

2.5 Summary.

An extensive summary of Cloud Synergy's organisational profile, including its services, structure, and strategic orientation, was given in this chapter. The McKinsey 7-S Framework's implementation demonstrated how its internal elements cooperate to attain operational excellence.

Being a technology-driven educational institution, Cloud Synergy's focus on digital campaigns and analytics is a perfect fit with this dissertation's research goal, which is to use Power BI to analyse marketing performance.

2.6 Conclusion.

This Chapter highlights Cloud Synergy's position as one of India's top providers of professional education and certifications, with a particular emphasis on SAP training, cloud computing, and data analytics. The chapter describes Cloud Synergy's industry-relevant curriculum, hybrid learning model, and use of digital marketing as its main enrolment tool. In order to show alignment with its digital marketing goals, the chapter examines the company's strategy, structure, systems, personnel, skills, style, and shared values using the McKinsey 7-S framework. It highlights how crucial data-driven decision-making, aided by BI tools such as Power BI, is for monitoring campaign

effectiveness, maximising marketing expenditures, and improving student acquisition. All things considered, this chapter makes Cloud Synergy a suitable case study for evaluating the efficacy of digital marketing through the use of sophisticated analytics tools.

CHAPTER 3

REVIEW OF LITERATURE AND RESEARCH DESIGN

3.1 Review of Literature & Gaps.

3.1.1 Introduction.

Understanding the theoretical and empirical underpinnings of this research is the main goal of the third chapter of this dissertation. In a digital world that is changing quickly, businesses are depending more and more on data analytics to help them make wise marketing choices. Examining earlier studies lays the groundwork for determining important factors that influence the success of digital campaigns, useful metrics for measurement, and analytical techniques that enhance performance.

Digital marketing is essential to Cloud Synergy's ability to draw in leads and turn them into enrolments because the company works in the education and training industry. To determine the current trends and gaps, a thorough analysis of the body of research on customer conversion, digital marketing analytics, and the application of business intelligence (BI) tools like Power BI has been carried out. The research design and methodology used in this study are also described in this chapter, along with the sampling strategy, data collection instruments, and analytical methods used to interpret the findings.

Incorporating Power BI into campaign analysis improves decision-making by converting unprocessed data into useful insights, in addition to offering visualisation benefits. In order to ensure that the research findings are reliable and applicable in actual marketing contexts, this chapter constructs the methodological link between theoretical understanding and real-world application.

3.1.2 Review of Literature.

3.1.2.1 Studies on Digital Marketing Performance.

1. **Chaffey & Ellis-Chadwick (2019) in Digital Marketing: Strategy, Implementation, and Practice.** Outlined how businesses can effectively measure user engagement and campaign ROI with the help of digital marketing analytics. They emphasised how crucial real-time data visualisation is to enhancing marketing effectiveness.
2. **Ryan (2020), in Understanding Digital Marketing,** underlined that the success of online campaigns depends on the ongoing tracking, measurement,

and optimisation of data using analytical tools. He found that business performance is directly impacted by metrics like ROAS, conversion rate, and click-through rate (CTR).

3. **Tiago and Veríssimo (2014) in Business Horizons.** Observed that customer-brand interactions have changed as a result of digital channels, making analytics essential for making decisions. According to their research, companies that implemented integrated analytics systems saw a 35% increase in customer retention.
4. **Kingsnorth (2022), in Digital Marketing Strategy: An Integrated Approach to Online Marketing,** emphasised how companies track ad performance across various channels, including Google, Meta, and LinkedIn Ads, using data-driven dashboards.

3.1.2.2 Studies on Business Intelligence (BI) and Data Visualization.

1. **Chen, Chiang & Storey (2012) in MIS Quarterly,** claimed that business intelligence tools improve decision-making by transforming unprocessed organisational data into useful insights. According to their research, BI is essential to attaining strategic agility.
2. **Power, Sharda & Burstein (2015) in Decision Support Systems,** outlined how managers can find hidden patterns and trends more quickly than with traditional methods by using visualisation dashboards, which simplify complex business data.
3. **Popovič et al. (2018) in Information Systems Frontiers,** noted that by facilitating data-driven decision-making at all levels, BI adoption dramatically enhances organisational performance.
4. **Laursen & Thorlund (2016), in Business Analytics for Managers,** talked about how managers can use tools like Tableau and Power BI to transform big data into useful performance metrics that inform business strategy.
5. **Mikalef et al. (2020) in Journal of Business Research,** highlighted that BI enables marketing teams to plan proactive strategies by predicting future outcomes in addition to aiding in data visualisation.

3.1.2.3 Studies on Power BI in Business and Marketing Analytics.

1. **Aithal & Aithal (2021) in International Journal of Applied Engineering and Management Letters,** emphasised that by integrating various data sources into cohesive dashboards, Microsoft Power BI improves decision-making. According to their findings, BI tools help organisations become more productive and strategically clear.
2. **Sivarajah et al. (2017), in Government Information Quarterly,** examined the ways in which visualisation tools, such as Power BI, enhance understanding and transparency in data analysis for both public and private organisations.
3. **Sharma & Dey (2022) in Journal of Business Analytics,** discovered that educational institutions are using Power BI for marketing analytics more and more to track trends in student enrolment, the effectiveness of ad campaigns, and the effectiveness of training programs.
4. **Kumar & Gupta (2020) in International Journal of Management Studies,** highlighted that marketing professionals can effectively track metrics like cost per lead and conversion ratio and analyse cross-channel performance with Power BI.
5. **Patel (2023), in International Journal of Data Analytics and Visualization,** pointed out that users can create custom KPIs using Power BI's integration with DAX (Data Analysis Expressions), which provides deeper insights into engagement patterns and campaign ROI.

3.1.2.4 Studies Related to Digital Marketing in Education Sector.

1. **Pradhan (2021) in Asian Journal of Education and Social Studies,** discovered that in order for educational institutions to draw students in highly competitive markets, digital campaigns have become crucial. His research highlighted how crucial ad targeting and high-quality content are to optimising sign-ups.
2. **Mishra & Kumar (2020), in International Journal of Marketing and Technology,** According to a study on online educational ads, using social media analytics can boost student enquiries by as much as 40%.

3. **Ganguly (2022) in Indian Journal of Marketing,** discovered that organisations using BI tools, such as Tableau and Power BI, are better able to track their marketing performance than those that only use manual tracking.

3.1.3 Research Gaps Identified.

The use of online marketing tools and techniques has advanced significantly, but there are still some important gaps, especially when it comes to integrating data visualisation tools like Power BI for performance evaluation, according to a review of the literature currently available on digital marketing and analytics. By examining earlier works, the following research gaps have been found:

1. Limited Research on Data-Driven Marketing in Educational Institutions:
   The majority of previous research on the effectiveness of digital marketing has concentrated on industries like retail, e-commerce, and hospitality (Tiago & Veríssimo, 2014; Chaffey & Ellis-Chadwick, 2019). However, the education and training sector—particularly in India—has received little attention. Few studies examine how data analytics can measure lead generation, sign-ups, and return on ad spend (ROAS) in this context, despite the fact that educational institutions like Cloud Synergy are depending more and more on digital campaigns to draw students.

2. Lack of Integration Between Marketing and Business Intelligence Tools:
   Although a lot of researchers have used CRM-based systems or Google Analytics to analyse the performance of digital campaigns, little attention has been paid to incorporating Business Intelligence (BI) tools like Power BI into marketing performance measurement. Although DAX-based KPI measurement, real-time insights, and sophisticated visualisation are made possible by BI tools, academic research has not yet fully tapped these technologies to comprehend the efficacy of campaigns.

3. Insufficient Analysis of Conversion Flow:
   Click-through rates or engagement levels as success indicators have been extensively covered in previous research (Ryan, 2016; Kotler et al., 2021). Nevertheless, a thorough flow analysis that depicts the real conversion process—from the click of the

advertisement to the final 23nrolment—is lacking. Although research in this area is still fragmented, understanding this journey is crucial for institutions that want to increase enrolment through digital ads.

4. Insufficient Comparative Analysis of Advertising Platforms:
   Few studies have compared the effectiveness of different digital channels in producing qualified leads, despite the fact that numerous studies have assessed Facebook, Instagram, and Google Ads separately. Incomplete conclusions regarding where marketing budgets should be optimised arise from the lack of comparative performance data across various digital platforms. For Cloud Synergy, which runs advertising campaigns across multiple platforms, this gap is essential.

5. Return on Ad Spend (ROAS) is not given much attention in the Indian context:
   The majority of Indian studies concentrate on customer reach or engagement rather than revenue efficiency per rupee spent, despite the fact that ROAS is one of the most important metrics for assessing the performance of digital marketing (Bansal & Sharma, 2020). The literature on digital marketing in India has not thoroughly examined the financial effects of ROAS in education-based campaigns.

6. Absence of Research Interpretation Based on Visualisation:
   Conventional marketing research frequently overlooks the power of visual storytelling through BI dashboards in favour of tabular and statistical analysis. There aren't many scholarly studies that show how Power BI dashboards can convert campaign data into understandable, actionable visuals. This offers a chance to connect scholarly theory with analytical instruments already employed by contemporary organisations.

7. Lack of Trend Analysis Based on Time:
   The majority of studies only show cross-sectional data without considering performance over time. Little research has been done on how lead generation and sign-ups change from month to month or during different campaign periods. Understanding seasonal differences in user engagement and conversion behaviour is hampered by this gap.

8. Inadequate Attention to Useful Information for Management Decision-Making: Though few studies convert findings into managerial recommendations that can direct campaign redesign or budget allocation, many studies place an emphasis on theoretical marketing models. Studies that directly connect BI-driven insights to marketing management business decision-making procedures are lacking.

3.1.3.1 Summary of Research Gaps.

In conclusion, the literature review identifies the following gaps, which the current study fills:

- There aren't many studies using Power BI to analyse digital marketing in academic settings.
- limited knowledge of tracking conversion flow and comparing campaigns across multiple platforms.
- Financial performance metrics (ROAS) are not given enough attention.
- Lack of managerially useful visualization-driven insights.

By integrating an analysis of leads, sign-ups, ROAS, and user conversion patterns using Power BI analytics on Cloud Synergy's digital campaign data, this study seeks to close these gaps. In doing so, it adds value to the expanding field of data-driven digital marketing from an academic and practical standpoint.

3.2 Statement of the Problem.

Marketing strategies have changed significantly in the current digital era. Online advertising platforms are being used by businesses more and more to connect with and interact with potential clients. However, success is not assured by simply executing digital campaigns. Businesses need to know which channels generate the best qualified leads, what kinds of ads work best, and how users move through the conversion funnel—from the first ad impression to the last purchase or enrolment.

Leading professional training company Cloud Synergy, which offers programs in SAP, cloud computing, and data analytics, has been making significant investments in digital marketing campaigns on a variety of platforms, such as Google Ads, Facebook,

Instagram, and LinkedIn. In spite of these expenditures, the management has trouble determining:

- Which advertising networks have the biggest impact on actual course enrolments?
- What kinds of campaigns have the highest return on ad spend (ROAS), and
- How prospective students proceed from clicking on advertisements to enrolling.

Although there are many different digital marketing analytics tools available, they frequently display data in fragmented formats, which makes it challenging for decision-makers to extract comprehensive insights. Uncertain ROI, poor campaign performance, and ineffective budget allocation are the outcomes of a lack of a cohesive analytical approach.

Additionally, Cloud Synergy and the majority of Indian educational institutions have not fully utilised Business Intelligence (BI) tools like Power BI to conduct a thorough analysis of their marketing data. Large datasets can be combined, interactive dashboards can be created, and patterns that traditional reports are unable to show can be visualised with the aid of BI tools. Making data-driven strategic decisions is hampered by the lack of integration between marketing performance data and BI-driven visualisation.

The necessity for an analytical framework that uses Power BI to convert Cloud Synergy's digital campaign data into actionable insights is thus the main issue this study attempts to address. In order to improve future marketing strategies, the study intends to measure ROAS, examine conversion patterns, and decipher the efficacy of various digital platforms.

"Cloud Synergy lacks a data-driven analytical framework to assess campaign effectiveness, comprehend user conversion flow, and maximise marketing investments, despite rising spending on digital campaigns. By using Power BI analytics to extract valuable business insights, this study aims to close this gap."

3.3 Need for the Study.

Businesses in every industry rely significantly on digital marketing to connect with their target audience in the cutthroat and data-driven world of today. However, audience engagement and ad visibility are no longer the only factors that determine success in digital marketing. It relies on an organization's ability to analyse marketing data, pinpoint high-performing channels, and allocate resources as efficiently as possible using quantifiable insights.

Digital campaigns are the main tool used by organisations in the professional education and training sector, such as Cloud Synergy, to draw in new students and advertise a range of technology-focused courses. The management frequently lacks clarity regarding which campaigns actually drive conversions and deliver the highest return on investment (ROI), despite the fact that the organisation runs campaigns across multiple online platforms, including Google, Facebook, Instagram, and LinkedIn.

Thus, it is imperative to carry out a methodical analytical investigation that compiles all digital campaign data into a single framework and assesses performance indicators like:

- Total number of leads produced on various platforms,
- Number of people who signed up for each type of campaign,
- ROAS (Return on Ad Spend), and
- The entire user conversion process, from advertisement to enrolment.

Even though traditional analytics tools are used by many organisations, they usually provide discrete insights rather than a comprehensive performance overview. With the aid of business intelligence (BI) tools such as Power BI, managers can monitor key performance indicators (KPIs) in real time and visualise campaign data in a more meaningful way.

Therefore, this research is crucial to:

- Close the gap between unprocessed digital marketing data and useful business insights.
- Give Cloud Synergy the ability to make data-driven marketing choices.
- Show how useful Power BI is for making decisions in the field of education marketing.
- Assist management in comprehending the factors that affect lead conversions and the performance of various digital platforms over time.

In conclusion, the necessity of this study stems from the need to develop a methodical, visual, and analytical approach to comprehending the performance of digital marketing in order to increase marketing effectiveness, optimise ad spending, and improve strategic decision-making at Cloud Synergy.

3.4 Scope of the Study.

The goal of the current study is to evaluate the effectiveness of digital marketing initiatives run by Cloud Synergy, a top professional training organisation with programs in data analytics, cloud computing, and SAP. The main goal of the study is to use analytical tools from Microsoft Power BI to better understand user conversion journeys and the efficacy of different digital advertising platforms.

The following dimensions are used ”o de’Ine the study's scope:

1. **Organizational Scope.**
   This study is limited to Cloud Synergy’s digital marketing department, which oversees lead-generation campaigns and online promotions on sites like LinkedIn, Facebook, Instagram, and Google Ads. The marketing and management teams in charge of campaign design, budget allocation, and performance monitoring will find the insights obtained to be directly applicable.

2. **Functional Scope.**

   The functional scope includes:

   - Performance analysis of digital campaigns with Power BI
   - Determining which advertising platforms are best for generating leads,
   - Campaign types are evaluated using Return on Ad Spend (ROAS) and conversion rates.
   - Key marketing metrics are visualised using interactive charts and dashboards.

3. **Geographical Scope.**

   Bengaluru, Hyderabad, Delhi, Chennai, Kochi, and Mumbai are the six major Indian cities where Cloud Synergy operates, according to the study. These cities were picked because they are important for lead generation and enrolment analytics, and Cloud Synergy actively operates its training facilities and digital campaigns there.

4. **Time Scope.**

   Three months—August, September, and October 2025—make up the analysis period. Cloud Synergy ran a number of digital marketing campaigns during this time to advertise its courses in data analysis, cloud computing, and SAP. Only campaign performance from this time frame is represented in the data used for this analysis.

5. **Analytical Scope.**

   Power BI is the main analytical tool used in this study to visualise campaign data and produce insights. Metrics like leads, sign-ups, conversions, and ROAS were examined with Power BI's trend lines, KPI dashboards, and DAX

formulas. For managerial decisions about investments in digital marketing, the analysis offers a quantitative foundation.

6. **Managerial Scope.**
   The study's findings are meant to assist Cloud Synergy in making strategic marketing choices, such as:

   - Maximising marketing expenditures on various platforms,
   - Finding campaigns that are performing well,
   - Recognising how prospective students behave online, and
   - Enhancing conversion effectiveness by interpreting data more accurately.

Therefore, the study's scope includes using Power BI as the analytical framework to analyse and interpret Cloud Synergy's digital marketing data within a specified timeframe and geographic area. It is anticipated that the results will help management achieve data-driven decision-making, improve marketing productivity, and refine strategy.

3.5 Objectives of the Study.

3.5.1 Primary Objective.

This study's main goal is to evaluate the success of Cloud Synergy's digital marketing campaigns from August, September, and October of 2025 using Microsoft Power BI as the analytical tool. The goal is to convert unstructured marketing data into valuable business insights so that Cloud Synergy's management can make data-driven decisions to increase campaign performance, ROI, and overall marketing effectiveness.

3.5.2 Specific Objectives.

- To measure performance across platforms: Finding the digital channels that produced the most leads and sign-ups during the study period, including Google Ads,

Facebook, Instagram, LinkedIn, YouTube, and email marketing, is the main goal of the first objective. This objective seeks to identify the platform that produced the highest return on ad spend (ROAS) by examining important metrics such as impressions, clicks, leads, conversions, and costs. By being aware of this, Cloud Synergy will be able to more effectively distribute its future marketing budget among the platforms with the highest potential for engagement and conversion.

- To assess the efficacy of ads: This goal compares the ability of different advertising formats, including sponsored posts, video campaigns, display ads, and search ads, to draw in new students. Click-through rates (CTR), conversion ratios, and engagement levels are all examined in the analysis. The study will determine which ad formats produce the best quality leads at the lowest cost and which ad types most effectively connect with the target audience through Power BI visualisation.

- To chart and examine the conversion process: To determine where most leads are lost during the process, a thorough mapping of the conversion funnel (Impression → Click → Lead → Sign-up → Enrolment) will be helpful. Finding the marketing funnel's weak spots, like low sign-up conversion rates or high cost per acquisition, is the main goal of this objective. Cloud Synergy can lower drop-off rates and raise the overall enrolment rate from digital marketing channels by implementing strategic interventions after comprehending this flow.

- To gauge the effectiveness of finances: Metrics like Cost per Lead (CPL), Cost per Enrolment (CPE), Total Ad Spend, Total Revenue, and Return on Ad Spend (ROAS) will be used to analyse the campaigns' financial aspects. This goal is essential for figuring out whether Cloud Synergy's marketing investment produced quantifiable results. Decision-makers can spot trends in excessive spending, cost effectiveness, and areas that need improvement to increase profitability by visualising these metrics in Power BI.

- To evaluate performance at the device and geographic levels: The effectiveness of digital marketing frequently differs depending on the device and location. Finding

trends, such as which cities (like Bengaluru, Chennai, Kochi, Hyderabad, Delhi, and Mumbai) and devices (like mobile vs. desktop) produced better results, is the main goal of this objective. Cloud Synergy can improve the overall efficacy of their marketing strategy by customising future campaigns to target high-performing regions and devices through the analysis of location-based and device-based segmentation.

- To create dashboards and KPIs that are driven by visualisation: This goal places a strong emphasis on using Power BI to create interactive dashboards and Key Performance Indicators (KPIs). The marketing and management teams at Cloud Synergy will be able to track campaign performance in real time thanks to these dashboards. Complex datasets will be simplified by the visualisations, facilitating timely decision-making and marketing insight interpretation for non-technical users. This further illustrates Power BI's usefulness in educational marketing analytics.

- To suggest data-driven marketing enhancements: The study intends to make practical suggestions that can aid in optimising Cloud Synergy's upcoming digital campaigns based on the analytical results. These suggestions will concentrate on enhancing budget distribution, audience segmentation, creative strategy, and targeting. The objective is to assist the company in achieving increased cost effectiveness, conversion rates, and lead quality.

- To illustrate how Power BI can be used practically in educational marketing analytics: The ultimate goal is to demonstrate the efficient use of tools such as Power BI in the analysis of marketing data in the field of education and training. Cloud Synergy can create a data-driven culture that prioritises insight-based decision-making by using this study. It also acts as a template for other educational institutions looking to enhance their marketing effectiveness and student acquisition tactics through data analytics.

3.5.3 Outcome-oriented Objective.

Delivering an extensive performance evaluation report for Cloud Synergy's marketing campaigns, bolstered by Power BI dashboards and interpretations, is the ultimate goal of this research. The management will be able to make evidence-based strategic decisions as a result, guaranteeing that marketing expenditures are maximised and in line with the organization's long-term growth goals.

3.6 Research Design.

A research design serves as the study's road map, directing the collection, analysis, and interpretation of data.

A descriptive research design has been chosen for this dissertation. Examining current data patterns, behaviours, and results pertaining to Cloud Synergy's digital campaigns is made easier with this design. The goal is to use Power BI visualisations to explain and interpret the relationship between marketing efforts and campaign performance outcomes, not to change variables.

The goal of this study is to analyse digital marketing data, interpret trends, and derive insights to optimise performance. Descriptive design aids in determining what is happening, how it is happening, and why it is happening.

3.6.1 Type of Research.

The current study uses a quantitative, descriptive, and analytical research approach and is titled "Decoding Digital Campaigns: Business Insights through Power BI at Cloud Synergy, Bengaluru."

One of the most important phases of a dissertation is choosing the research type, which dictates the methods for gathering, processing, and interpreting data. The selected research methodology is in line with the study's objective, which is to assess actual marketing performance data and use analytical tools like Power BI to produce actionable business insights.

1. **The use of quantitative research methods:** Because it deals with quantifiable and numerical data gathered from Cloud Synergy's digital campaigns, this study is primarily quantitative. The information contains numbers that can be measured and statistically examined, including impressions, clicks, leads, sign-ups, ad spends, and conversion rates. Quantitative research allows for objective measurement, helping identify patterns and relationships between variables (for example, between platform type and ROAS). By using Power BI, the study converts raw quantitative data into meaningful visual insights that support evidence-based decision-making. To put it simply, the data illustrates the performance of various platforms, ad formats, and locations as well as the implications for Cloud Synergy's marketing success.

2. **Design of Descriptive Research:** Instead of changing variables or testing hypotheses, the study uses a descriptive research design, which focusses on characterising and interpreting the data that is already available. The "what," "how," and "why" questions of the research problem are addressed by descriptive research.

   In this regard, the study aims to explain:

   - What transpired during Cloud Synergy's campaigns (such as conversions, sign-ups, and leads).
   - The performance of various ad formats and platforms.
   - Why some campaigns outperformed others in terms of conversions or ROAS.

   Based on data-driven evidence, this design aids in providing a concise and accurate description of Cloud Synergy's digital marketing environment.

3. **Analytical Research Nature:** Because it goes beyond simple description and analyses and interprets data to identify significant relationships and performance drivers, the research also has a strong analytical component. The study looks at metrics like these using Power BI visualisation and DAX (Data Analysis Expressions):

   - CPL, or cost per lead

- Enrolment Cost (CPE)
- ROAS, or return on ad spend
- Rate of Click-through (CTR)
- Efficiency of Conversion Flow

The study finds patterns, trends, and insights using this analytical method that can direct Cloud Synergy's future marketing choices. The study can help the organisation optimise its advertising strategy by identifying the platforms that yielded the highest return for each rupee spent, for instance, by analysing ROAS.

4. **Exploratory Element:** The study has an exploratory component even though its main focus is descriptive and analytical. Investigating a topic that hasn't been thoroughly examined previously is known as exploratory research. This dissertation breaks new ground because there aren't many studies that use Power BI to analyse the effectiveness of digital campaigns in educational institutions. It looks at how managerial decision-making, performance reporting, and marketing intelligence can all be enhanced in the training and education industry by using visualisation tools. As a result, the study creates new opportunities for educational institutions to implement data-driven marketing strategies.

3.6.2 Research Framework.

Stage	Description	Tools Used
Stage 1: Data Collection	Gathering campaign performance data from Cloud Synergy's ad platforms and CRM.	Internal Reports, Excel

Stage	Description	Tools Used
Stage 2: Data Preparation	Cleaning, formatting, and consolidating data for uniformity.	Power Query
Stage 3: Data Analysis	Performing calculations and creating DAX measures for KPIs and trends.	Power BI
Stage 4: Visualization & Dashboarding	Designing dashboards for campaign insights and performance monitoring.	Power BI
Stage 5: Interpretation & Insights	Analyzing patterns, drawing conclusions, and suggesting improvements.	Power BI

Table No: 3.1

3.6.3 Method of Analysis.

To analyse and interpret the connections between different campaign performance metrics, including leads produced, sign-ups attained, and return on ad spend (ROAS), the study uses a data visualisation and descriptive analytics approach. Microsoft Power BI, a cutting-edge business intelligence tool that facilitates interactive and visually stimulating data exploration, is the main tool used in the analysis.

The study focusses on finding trends, patterns, and important insights from Cloud Synergy's marketing campaign data by combining quantitative metrics with visual dashboards. In order to facilitate data-driven decision-making, the analysis converts unprocessed numerical data into insightful visual representations.

For analytical interpretation, the following Power BI visualisations were employed:

1. Bar Charts: Comparing Platform Performance.

To compare the effectiveness of various marketing platforms (like Google Ads, Facebook Ads, or LinkedIn Ads) over several campaign periods, bar charts were used. The most successful marketing channels were made clear by this visualisation, which also helped determine which platform produced the most leads, conversions, and engagement.

2. Device Usage Distribution Pie Charts.

The percentage of users interacting with campaigns on different devices, including tablets, smartphones, and PCs, was displayed using pie charts. The company was able to tailor its marketing content to the most popular device type thanks to this visual format, which gave a concise and clear overview of the audience's device preferences.

3. Monthly Trend Analysis with Line Charts.

During the three months of August, September, and October 2025, line charts were used to examine monthly trends for important metrics such as total leads, sign-ups, and advertising spend. This aided in determining seasonal effects, upward or downward trends, and long-term performance stability.

4. Conversion Flow Analysis with Funnel Charts.

From the total number of leads generated to the number of final sign-ups, funnel charts provided a visual representation of the customer journey. The campaign was successful in keeping potential customers through each step of the funnel, as evidenced by the drop-off rates and conversion efficiency at each stage (Leads → Interested → Registered → Signed-up).

5. KPI Cards: Overview of Key Metrics.

Major quantitative results like Total Leads (12,000), Total Sign-ups (4,284), and Return on Ad Spend (ROAS = ₹22.82) were highlighted using KPI (Key Performance Indicator) cards. These cards functioned as the dashboard's summary section, offering immediate insights into the overall effectiveness of the campaign.

For clarity, each visualisation was set up with the appropriate axes and legends:

- Typically, the X-Axis stood for time periods, advertising avenues, or kinds of devices.
- Quantitative metrics like the quantity of leads, conversions, or expenses were represented by the Y-Axis.
- To differentiate between audience segments or campaign categories, legends were used.

When combined, these visualisations offered a comprehensive overview (total campaign performance) as well as a more detailed perspective (platform-specific or monthly analysis). The researcher was able to assess the campaign's effectiveness, audience behaviour, and marketing results in a methodical, data-driven way thanks to the combination of visuals.

3.6.4 Data Interpretation Approach.

The foundation of this study's data interpretation process is the use of Power BI's analytical and visualisation tools to transform numerical campaign metrics into insightful business information. Finding trends, connections, and useful patterns in the data gathered from Cloud Synergy's digital campaigns is the main goal of the methodology.

A methodical, multi-phase approach was used in the interpretation process:

1. **Data Preparation and Cleaning:** Power Query in Power BI was used to import raw datasets from various advertising platforms. Duplicate entries, missing values, and

inconsistent data were found and fixed. Each field — such as Impressions, Clicks, Leads, Sign-ups, and Ad Spend — was standardized for consistency across all platforms.

2. **Data Modelling:** To facilitate cross-comparison and dynamic reporting, connections were made between important fields like Platform, Ad Type, and Conversion Stage. Visualising the complete marketing funnel, from lead generation to final enrolment, was made easier by hierarchical relationships.

3. **Descriptive Analytics:** DAX (Data Analysis Expressions) in Power BI was used to compute descriptive statistics, such as sums, averages, and ratios. To understand efficiency and profitability, metrics such as ROAS (Return on Ad Spend), Cost per Lead, and Conversion Rate were calculated.

4. **Visualisation and Comparative Interpretation:** To compare metrics across platforms, devices, and months, a variety of Power BI visualisations were employed, such as bar, line, and funnel charts. These illustrations made it easier to determine which ad format or platform did best during the study period (August–October 2025).

5. **Performance Benchmarking:** ROAS (₹22.82), sign-ups (4,284), and total leads (12,000) were benchmarked using KPI cards. These metrics functioned as performance standards to evaluate the degree to which marketing investment produced observable outcomes.

6. **Derivation of Insight:** The visual dashboards made it possible to interpret patterns intuitively, such as which digital platform produced the highest conversion rate or how user engagement differed between devices. Both quantitative measurements and visual patterns were used to draw insights, guaranteeing a balance between strategic awareness and numerical accuracy.

This method of data interpretation places a strong emphasis on decision-making, relevance, and clarity. It analyses what the data suggests for Cloud Synergy's future

marketing strategies, including budget allocation, campaign timing, and audience targeting, rather than concentrating only on numerical results.

3.6.5 Expected Outcomes of the Research Design.

This study's research design was organised to yield thorough, useful, and actionable results that enhance Cloud Synergy's digital marketing strategy and scholarly comprehension of BI-driven marketing analysis.

1. **Finding High-Performing Platforms:**
   The study's goal is to identify the online platforms (like Google, Meta, or LinkedIn) that produce the most leads and sign-ups so that the company can direct its marketing budget towards these channels.

2. **Recognising Ad Type Effectiveness:**
   The study compares various ad formats, such as display ads, video ads, or carousel posts, in order to determine which creative type increases engagement and conversion rates.

3. **Conversion Flow Analysis:**
   The research design should show the user journey from Ad Click to Lead to Registration to Sign-up, giving insight into possible drop-off points in the marketing funnel. This enhances customer journey mapping and retention tactics.

4. **Visualisation of Key Marketing Metrics:**
   The company can view real-time visuals for metrics like leads, sign-ups, cost per conversion, and return on assets (ROAS) via Power BI dashboards. These dashboards facilitate data-driven decision-making and make it simple for management to keep an eye on marketing performance.

5. **Improved Decision-Making with BI:**
   One of the main results is to demonstrate how business intelligence tools, such as Power BI, make complex campaign analysis easier to understand and offer rapid,

interactive insights. For upcoming campaign planning, this encourages evidence-based decision-making.

6. **Operational Efficiency:**
   The study is also expected to demonstrate how integrating Power Query and Power BI streamlines data handling and reporting processes — reducing manual effort and improving accuracy.

7. **Strategic Marketing Recommendations:**
   The study should provide useful recommendations for maximising budget allocation, enhancing digital engagement, and improving ad targeting based on data insights.

8. **Academic Contribution:**
   This study makes a scholarly contribution beyond its business value by demonstrating the efficient use of BI tools and data visualisation techniques in digital marketing analytics within an educational services organisation.

To sum up, this research design's anticipated results are meant to close the gap between theoretical knowledge and real-world business implementation. In addition to offering Cloud Synergy quantifiable campaign insights, the study creates a repeatable analytical framework for upcoming marketing assessments.

3.7 Sampling Framework.

A sampling framework outlines the process for identifying, choosing, and using the population or data for analysis in a study. The sampling framework used in this study is based on data from Cloud Synergy's digital marketing campaign, which represents all advertising activities carried out over the course of the three-month August, September, and October 2025 period.

Examining how well various marketing platforms, including Google Ads, Facebook, Instagram, LinkedIn, and YouTube, perform in producing leads and sign-ups for Cloud

Synergy's professional training programs is the main goal of the study. The study uses a census sampling approach, which takes into account the complete dataset rather than a small representative sample, because the data includes complete campaign records for the specified duration.

3.7.1 Key Elements of the Sampling Framework.

1. **Population:** All digital marketing campaigns conducted by Cloud Synergy during the study period in Bengaluru, Hyderabad, Chennai, Kochi, Delhi, and Mumbai comprise the population for this study.

2. **Sampling Unit:** Every campaign is handled as a distinct sampling unit, as are all of its performance indicators, such as impressions, clicks, leads, sign-ups, and ROAS.

3. **Sampling Method:** The Census Method is used since all campaigns and the performance data they are linked to are analysed. This offers a thorough and objective understanding of the efficacy of campaigns.

4. **Sample Period**: Three consecutive months of campaign performance are captured during the analysis period, which runs from August 2025 to October 2025.

5. **Sample Size:** The dataset includes 4,284 confirmed sign-ups and roughly 12,000 total leads, spanning various campaign formats and geographical areas.

6. **Sampling Goal:** By ensuring accuracy and inclusivity, the sampling framework enables the researcher to assess marketing efficiency in its entirety rather than depending solely on estimates from a smaller subset of data.

This method ensures accuracy in data-driven conclusions by covering all pertinent campaign outcomes within the allotted timeframe, which aids in the acquisition of realistic and generalisable insights.

3.8 Demographic outline of the respondents.

The demographic information taken from Cloud Synergy's digital marketing performance reports offers important insights into the audience's origins and campaign engagement, even though the majority of the study is based on secondary campaign data. By providing insight into user behaviour across devices and regions, these demographic patterns facilitate the development of more targeted digital marketing campaigns.

The Power BI analysis of the dataset included both (a) Geographical Distribution and (b) Device Usage Patterns.

a) Geographical Distribution.

The regional performance of Cloud Synergy's digital campaigns in six major Indian cities—Bengaluru, Hyderabad, Delhi, Chennai, Kochi, and Mumbai—is highlighted by the geographical data.

Bengaluru had the most leads and sign-ups, according to the analysis, followed by Hyderabad. This suggests that these areas have significant market potential and brand awareness, most likely as a result of the greater concentration of IT professionals and students looking for training programs focused on technology.

While Delhi and Mumbai displayed varied campaign responses based on the ad types and platforms used, cities like Chennai and Kochi demonstrated moderate engagement levels, reflecting growing digital interest.

Cloud Synergy can use this geographic distribution to optimise ad spending and resource allocation in high-performing cities, as well as to see how regional audience characteristics impact the efficacy of digital campaigns.

b) Device Usage Patterns.

Important information about how audiences engage with Cloud Synergy's digital advertisements was obtained through device-based user segmentation.

The campaign data confirmed the target audience's predominance of mobile usage by showing that mobile devices contributed the largest share of impressions, clicks, and leads. However, desktop users showed relatively higher intent and conversion rates in terms of final sign-ups and conversions.

This pattern implies that desktop interactions are more conversion-oriented because users are more likely to finish registration forms or payments on larger screens, even though mobile ads are good at generating initial interest and engagement.

By being aware of this device preference, Cloud Synergy can improve the overall effectiveness of its campaigns by tailoring its landing pages and ad creatives for desktop conversion performance as well as mobile responsiveness.

Cloud Synergy uses demographic insights from device-based and geographic data to determine its target markets and audience engagement across various platforms. These results are essential for boosting user experience across devices and regions, improving targeting accuracy, and honing ad strategies.

The company can concentrate on device-optimized marketing campaigns and promotions tailored to specific regions by utilising these demographic insights, which will ultimately improve lead generation and enrolment results.

3.9 Tools for Data Collection.

Since the information was taken from Cloud Synergy's internal digital marketing platforms and performance reports, the study employed secondary data collection techniques. Because of their analytical robustness, dependability, and capacity to

manage complex datasets, the instruments used for data collection and preparation were selected.

1. **Ads Manager on Google:**
   Used to gather information about search and display ad campaign performance, including impressions, clicks, costs, and conversions. This aided in the analysis of the engagement and reach produced by sponsored Google campaigns.

2. **Instagram and Facebook Meta Ads Manager:**
   Helped compare the performance of social engagement with search-based campaigns by offering comprehensive insights into audience interactions, engagement metrics, and lead generation across social media platforms.

3. **Campaign Manager on LinkedIn:**
   Used to gather information about business-to-business (B2B) campaigns aimed at corporate and professional audiences. This was crucial for gauging the effectiveness of sign-ups and lead quality in the professional training industry.

4. **Analytics on YouTube:**
   The researcher was able to assess the effect of video-based marketing on lead generation and brand awareness by gathering data on video performance, such as watch time, viewer demographics, and click-through rates.

5. **Excel:**
   Acted as the main data handling tool for tabular organisation, formatting, and preliminary data cleaning. Data was imported into Power BI after datasets were combined, duplicates were eliminated, and important columns were standardised using Excel.

6. **Microsoft Power Query (in Power BI):**
   Filtering, appending, merging, and reshaping big datasets into an organised analytical model were all done with Power Query. Accuracy and consistency of data across sources were guaranteed by this tool.

7. **Power BI from Microsoft:**
   The main tool for analysis and visualisation was Power BI. Through DAX (Data Analysis Expressions), it made interactive data analysis easier and allowed for the computation of crucial KPIs like:

   - Total Number of Leads Produced
   - Total Number of Sign-Ups
   - CPL, or cost per lead
   - Rate of Conversion
   - ROAS, or return on ad spend

Together, these tools made it possible to extract insightful information from Cloud Synergy's campaign data in a methodical, data-driven manner.

3.10 Limitations of the Study.

Despite the fact that this study offers insightful information about the effectiveness of digital campaigns, a number of limitations must be noted in order to put the results in context:

1. **Dependency on Secondary Data:** Cloud Synergy's secondary data served as the study's sole source of information. The methods used to collect the data and its initial accuracy were beyond the researcher's control.

2. **Limited in Time:** The study's scope is limited to the three months from August to October of 2025. Consequently, the results may not reflect long-term or seasonal marketing trends and instead reflect the performance of a short-term campaign.

3. **Limited to Digital Platforms:** The study only looks at data related to online marketing; offline advertising channels like partnerships, events, and print promotions are not included.

4. **Reporting Differences Among Platforms:** Different attribution models and algorithms are used by Google, Meta, LinkedIn, and YouTube, among other advertising platforms. When integrating cross-platform data, these variations could cause minor inconsistencies.

5. **Absence of Qualitative Insights:** The study mostly examines quantitative data and skips over qualitative elements like motivation, customer satisfaction, and the post-enrolment experience.

6. **Dynamic Market Environment:** Outside variables that are out of the researcher's control, like competitor activity, modifications to ad platform policies, or changes in consumer preferences, can cause variations in digital marketing performance.

7. **Limited Generalisation:** The results are unique to Cloud Synergy and its marketing strategy that emphasises training. As a result, they might not be directly transferable to other sectors or organisations with distinct marketing objectives.

Notwithstanding these drawbacks, the study's precise data modelling, BI-driven interpretation, and methodological consistency preserve data validity and analytical rigour. The conclusions drawn are still very applicable to managerial use in digital marketing analytics as well as scholarly comprehension.

3.11 Summary.

With an emphasis on key performance indicators like ROAS, conversion rates, and click-through rates, the literature review thoroughly investigates digital marketing analytics. It draws attention to research gaps in the use of business intelligence tools, such as Power BI, in the field of education, particularly the scant examination of cross-platform comparisons and conversion patterns. The research design of the study is thorough and includes data collection techniques, sampling strategies, and analytical

frameworks. This foundation creates the methodological framework for assessing marketing campaigns and user engagement in an educational setting and supports a thorough investigation of the efficacy of digital marketing.

3.12 Conclusion.

The review highlights how important it is to integrate cutting-edge analytical tools in order to fill in the gaps in digital marketing performance evaluation. Data-driven insights that improve comprehension of lead conversion, campaign effectiveness, and budget allocation are made possible by using Power BI. The research design offers a methodical way to examine and improve digital marketing tactics, guaranteeing accuracy and pertinence in performance evaluation. Through technology-enabled marketing analytics, these insights are crucial for making strategic, well-informed marketing decisions that ultimately support the company's goals of optimising campaign impact and gaining a long-term competitive advantage.

CHAPTER 4

DATA ANALYSIS AND INTERPRETATION

4.1 Details of Tools Used for Data Analysis.

The most important phase of any research project is data analysis, which transforms unstructured and unorganised data into insights that are meaningful, actionable, and structured. Effective analysis is crucial in today's data-driven business environment to comprehend performance outcomes, relationships, and trends that have a direct impact on managerial decision-making.

Data for this study came from a variety of digital marketing platforms that Cloud Synergy uses, including YouTube, Facebook, Instagram, LinkedIn, and Google Ads. Traditional manual analysis techniques were inadequate due to the large and multifaceted volume of data, which included metrics such as impressions, clicks, leads, sign-ups, and ad spend. As a result, Microsoft Power BI was used as the main analytical tool in a business intelligence (BI) approach.

A methodical and scientific approach to data analysis was made possible by Power BI in conjunction with auxiliary tools such as Microsoft Excel (for the preparation of structured data), Power Query (for the extraction, transformation, and loading of data), and DAX (Data Analysis Expressions) (for dynamic computations). When combined, these tools offered a comprehensive analytical workflow that guaranteed precision, dependability, and interpretability in turning unprocessed campaign data into insightful marketing information.

Several benefits resulted from the integration of these tools:

- Increased precision as a result of automated computations and error-free processing.
- Efficiency in managing vast amounts of data from digital campaigns.
- Dynamic dashboards and reports provide visual clarity.
- Improved ability to make decisions by providing useful information.

Therefore, the core of the analytical methodology used in this study was the combination of Excel, Power Query, DAX, and Power BI.

4.1.1 Tools Used for Analysis.

1. **Microsoft Excel: For Preparing Structured Data.**

   The first step was to use Microsoft Excel to arrange the campaign data in a methodical manner before importing it into Power BI. Excel served as a platform for formatting and data structuring, combining, validating, and cleaning the raw datasets that were taken from various digital advertising sources.

   By using Excel, the data was guaranteed to be error-, inconsistency-, and duplicate-free. Every dataset had consistent column header formatting, including:

   - Platform (Google Ads, Facebook, Instagram, etc.)
   - Campaign Type
   - Impressions
   - Clicks
   - Leads Generated
   - Sign-ups
   - Ad Spend
   - Revenue

   To guarantee logical consistency and readability, Excel's built-in features—such as sorting, filtering, data validation, and tabulation—were employed.

   Excel played a crucial role in data structuring even though it wasn't used for visual analysis. For a seamless integration into Power BI, it made sure the datasets were correctly aligned. In the later phases of analysis, the structured format also made data linking and model creation easier.

   In conclusion, Excel acted as the foundation layer for the data, converting unstructured and raw data into a standardised, clean dataset that was prepared for further analysis.

2. **Power Query for the Extract, Transform, and Load (ETL) Process (in Power BI).**

The data was prepared in Excel and then imported into Power BI using Power Query, which carried out the Extract, Transform, and Load (ETL) process.

Because it guarantees that only relevant, consistent, and high-quality data is entered into the analytical model, this procedure is an essential first step in business intelligence projects.

Extract: Information was taken out of several digital marketing platforms and put into Power BI. This contained information on impressions, clicks, leads, and conversions at the campaign level.

Change: Power The datasets were cleaned and improved using Query's transformation tools. The researcher completed the following tasks:

- Removing duplicates and unnecessary columns.
- Standardizing date formats and text cases.
- Replacing null or missing values with appropriate entries.
- Merging tables and aligning column names for consistency.
- Converting numerical data types for accurate calculation

Load: The cleaned dataset was put into Power BI's data model after the transformation was finished. Calculations, visualisations, and interpretations were then performed using this integrated and structured data.

Power Query made the data integration and cleaning process automated, effective, and repeatable. It ensured that every Power BI insight was founded on precise and verified data, removing the possibility of human error that frequently arises with manual data handling.

3. **For computations and performance metrics, use DAX (Data Analysis Expressions).**

Advanced calculations were then carried out using DAX (Data Analysis Expressions) after the cleaned data had been loaded into Power BI.

With Power BI, users can create dynamic calculations, measures, and key performance indicators (KPIs) using the DAX formula and expression language.

Essential marketing metrics that assisted in assessing Cloud Synergy's digital campaign performance were calculated in this study using DAX. Among the crucial actions were:

1. Total Leads Generated: The total number of leads obtained from different advertising channels.

SUM(Leads) = Total Leads

2. Total Sign-ups: The sum of all registrations or conversions brought about by the campaigns.

SUM(Sign-ups) = Total Sign-ups

3. Conversion Rate (CR): This gauges how well campaigns turn leads into sign-ups.

(Total Sign-ups / Total Leads) × 100 is the conversion rate.

4. Cost per Lead (CPL): By dividing the total amount spent on advertising by the quantity of leads produced, this metric evaluates cost effectiveness.

Total Ad Spend / Total Leads = CPL

5. Return on Ad Spend (ROAS) compares total revenue with total advertising expenditure to assess profitability.

Total Revenue / Total Ad Spend = ROAS

Real-time and dynamic analysis were made possible by the use of DAX. The measures automatically recalculated when filters like "city," "device," or "platform" were applied, instantly providing context-specific insights.

This adaptability made it possible for the researcher to perform in-depth analytical comparisons and assess campaign performance from a variety of angles, including operational, behavioural, and financial.

4. Microsoft Power BI: For Interpretation and Visualisation.

Microsoft Power BI was used to conduct the last and most important stage of analysis. All processed and calculated data was transformed into interactive dashboards, charts, and KPI cards using this all-inclusive visualisation and reporting platform.

The following elements of Power BI gave Cloud Synergy's marketing data an easy-to-understand, visual representation:

- Platform-wise performance comparisons were shown in bar charts (e.g., Google Ads vs. Facebook vs. LinkedIn).

- Pie charts showed the percentage distribution of leads and sign-ups by campaign category or device type.

- Line charts: Displayed time-series trends for metrics from August to October 2025, including total leads, sign-ups, and ad spend.

- The customer conversion flow from ad impressions to final sign-ups was depicted by funnel charts.

- KPI Cards: compiled key performance metrics, including ROAS, cost per lead, total leads, and total sign-ups.

These images gave a clear picture of how well Cloud Synergy's campaigns worked on various platforms, gadgets, and time periods. The interactive tools in Power BI, such as drill-through options, slicers, and filters, allowed for a more thorough examination of the data, enabling the researcher to spot trends, abnormalities, and areas for development.

Additionally, Power BI provided real-time updating features that allowed for dynamic data interaction without requiring tedious manual tasks. As a result, the analytical procedure became more accurate, efficient, and user-friendly.

Overall, Power BI supported data-driven strategic planning and gave Cloud Synergy's management a clear grasp of campaign results, acting as more than just a visualisation tool.

In conclusion, the data analysis tools employed in this study created a cohesive analytical ecosystem that guaranteed precision, effectiveness, and comprehension depth.

- Excel organised unstructured data to provide the framework.
- Power Query used ETL operations to prepare and refine the data.
- To determine important marketing indicators, DAX carried out the required computations.
- The processed data was visualised using Power BI to create informative dashboards that could be interpreted.

When combined, these tools produced a smooth analytical process that made it possible to fully comprehend Cloud Synergy's performance in digital marketing. The goal of the study was to demonstrate how business intelligence tools can improve marketing analytics in the education sector. Power BI, with the help of these supplementary tools, converted complicated datasets into insightful knowledge.

4.2 Data Analysis and Interpretation.

The data gathered from Cloud Synergy's digital campaign performance reports is analysed and interpreted in this section. The aforementioned tools were used to conduct the analysis, and for easier comprehension, the results are displayed as graphs, KPI cards, and charts.

This analysis's primary goal is to interpret the ways in which various elements—like location, device usage, and campaign performance metrics—impacted how successful digital marketing campaigns were. Aspects of the study's goals are represented by each chart and KPI card, which shows how leads were created, converted, and made money across different platforms and time periods.

Interpreting data entails not just summarising numerical results but also elucidating their business implications. For instance:

- Finding the cities that generated the most leads and sign-ups is made easier with the use of geographic analysis.
- Device analysis shows how audiences behave on desktop and mobile devices.
- Campaign effectiveness and profitability are shown by financial KPIs such as Cost per Lead (CPL) and Return on Ad Spend (ROAS).
- Seasonal patterns and changes in performance over time are highlighted by monthly trends.

The study evaluates campaign results in light of Cloud Synergy's marketing goals by means of methodical data analysis. In the following chapter, managerial insights and strategic recommendations are derived from this interpretation.

4.2.1 Overview of Visual Analysis in Power BI.

Several Power BI visuals, each with a distinct analytical function, were employed to gather thorough insights:

Visualization Type	Purpose / Insight Derived
Bar Charts	Compared performance across platforms, cities, or ad types to determine which channel performed best.
Pie Charts	Showed the proportional distribution of leads and sign-ups by device usage or campaign category.
Line Charts	Displayed monthly trends for metrics such as leads, sign-ups, and ad spend to identify performance fluctuations.
Funnel Charts	Represented the conversion journey from total leads to final sign-ups, highlighting drop-off stages.
KPI Cards	Summarized key marketing metrics such as Total Leads, Total Sign-ups, Cost per Lead (CPL), and ROAS (₹22.82).

Table No: 4.1

Together, these images offered a comprehensive understanding of the efficacy of campaigns and the trends in consumer interaction. Dynamic exploration of marketing outcomes was made possible by Power BI's interactive filters, which enabled comparison across platforms, time periods, and audience segments.

4.2.2 Interpretation Framework.

In order to guarantee clarity and relevance to the goals of the study, the data interpretation procedure in this chapter adheres to a structured framework. The following dimensions have been used to interpret each visualisation:

- Understanding the geographic and device-based engagement patterns of users in various regions is possible with the help of demographic insights.
- Performance Insights: Examining the number of leads and sign-ups produced by different advertising campaigns and platforms.
- Financial Insights: Assessing important marketing KPIs to gauge profitability, such as conversion efficiency, ROAS, and CPL.
- Trend analysis is the process of determining monthly fluctuations and patterns of growth in order to evaluate the performance of a campaign over time.

Power BI assisted in identifying critical success factors and areas for enhancement in Cloud Synergy's digital marketing performance through this analytical framework.

4.2.3 Key Performance Indicator's.

Using key metrics (KPIs), the Power BI dashboard provides an overview of Cloud Synergy's overall performance in digital marketing. Every KPI represents a distinct aspect of marketing efficacy, from financial performance to cost effectiveness and engagement. Each KPI is explained in the following interpretations, which also include the DAX formula that was used to calculate it.

1. Total Impressions.

Fig No. 4.1

This statistic shows how many times Cloud Synergy's digital ads were shown overall on all internet channels (YouTube, Facebook, Instagram, LinkedIn, and Google Ads). Strong campaign reach and brand awareness among the target audience are indicated by a total of 2 million impressions. Effective audience targeting and ad distribution are reflected in a high impression volume.

Total Impressions = SUM('Campaign_Daily_Agg'[Impressions])

2. **Total Spend.**

Fig No. 4.2

This KPI shows the total amount spent on advertising over the course of the campaign. Cloud Synergy invested ₹739,000 in multi-platform paid advertising. Understanding the cost structure and computing financial metrics like CPL (cost per lead) and ROAS (return on ad spend) require tracking this spend.

Total Spend = SUM('Campaign_Daily_Agg'[AdSpend])

3. **Total Sign-ups.**

Fig No. 4.3

After interacting with the advertisements, this number represents the total number of users who finished the registration or sign-up process. 4,284 sign-ups in all show that the campaign successfully converted interest into action. Both the effectiveness of landing pages and the calibre of ad targeting are represented by this metric.

Total SignUps = SUM('Campaign_Daily_Agg'[SignUps])

4. **Sign-up to Enrolment Rate.**

Fig No. 4.4

This KPI calculates the percentage of users who proceeded from registering to actually enrolling in Cloud Synergy's courses. The sales team's successful nurturing and follow-up is demonstrated by the 50.93% conversion rate, which shows that half of the sign-ups moved on to enrolment.

SignUp to Enrol Rate = DIVIDE(SUM('Campaign_Daily_Agg'[Enrolments]), SUM('Campaign_Daily_Agg'[SignUps])) * 100

5. **Total Clicks.**

Fig No. 4.5

This shows how many times users clicked on Cloud Synergy's advertisements overall. The campaign garnered a respectable amount of audience interest and engagement with 49,000 clicks. It demonstrates the potency of call-to-action components, headlines, and ad creatives.

Total Clicks = SUM('Campaign_Daily_Agg'[Clicks])

6. **Average Cost per Click (Avg CPC).**

Fig No. 4.6

This KPI shows the average amount spent for each ad click. An average CPC of ₹14.95 indicates cost efficiency, suggesting that Cloud Synergy effectively managed bids and keyword strategies to achieve quality traffic at a reasonable cost.

Avg CPC = AVERAGE('Campaign_Daily_Agg'[AvgCPC_INR])

7. **Total Enrolments.**

Fig No. 4.7

This metric reflects the total number of students enrolled in Cloud Synergy's courses through digital marketing campaigns. The 2,182 enrolments signify the ultimate success of the marketing funnel — turning digital leads into actual customers.

Total Enrolments = SUM('Campaign_Daily_Agg'[Enrolments])

8. **Cost per Enrolment.**

Fig No. 4.8

This KPI assesses how cost-effective it is to turn a lead into an enrolment. With an average cost per enrolment (CPE) of ₹338.75, Cloud Synergy spent ₹338.75 to enrol one student. Given the high ROAS seen, this value is favourable and confirms the campaign's high profitability.

Cost Per Enrol = DIVIDE(SUM('Campaign_Daily_Agg'[AdSpend]), SUM('Campaign_Daily_Agg'[Enrolments]))

9. **Click-Through Rate (CTR).**

Fig No. 4.9

CTR gauges how engaging the ads were for viewers by dividing the number of clicks by the total number of impressions. For digital learning campaigns, a 3% CTR is regarded as above average, indicating skilfully created ad creatives and audience-relevant messaging.

CTR (%) = DIVIDE(SUM('Campaign_Daily_Agg'[Clicks]),
SUM('Campaign_Daily_Agg'[Impressions])) * 100

10. **Total Leads.**

Fig No. 4.10

The number of prospective clients who indicated interest by completing contact or inquiry forms is represented by this KPI. Campaigns were well-targeted and appealing to the appropriate demographic segments, as evidenced by the 12,000 total leads, which show a strong marketing reach and audience response.

Total Leads = SUM('Campaign_Daily_Agg'[Leads])

11. Lead to Sign-up Rate.

Fig No. 4.11

The number of leads that became actual sign-ups is indicated by this rate. About one-third of interested prospects registered, according to a conversion rate of 34.83%. This shows good remarketing communication and a moderately high lead quality.

Lead to SignUp Rate = DIVIDE(SUM('Campaign_Daily_Agg'[SignUps]), SUM('Campaign_Daily_Agg'[Leads])) * 100

12. Total Revenue.

Fig No. 4.12

The campaigns' financial success is demonstrated by the ₹17 million (₹1.7 crore) in total revenue from all enrolments. This yields a great Return on Ad Spend (ROAS) in relation to the ₹739K total spend, demonstrating that the digital campaigns were not only financially successful but also operationally successful.

Total Revenue = SUM('Campaign_Daily_Agg'[Revenue])

13. Return on Ad Spend (ROAS).

Fig No. 4.13

ROAS calculates the amount of money made for each rupee spent on advertising. The data shows that **ROAS = ₹17M / ₹739K = 22.82**

This indicates that Cloud Synergy made ₹22.82 for every ₹1 spent on marketing, which is a very good outcome that demonstrates the campaign's efficacy and high profitability.

ROAS = DIVIDE(SUM('Campaign_Daily_Agg'[Revenue]),
SUM('Campaign_Daily_Agg'[AdSpend]))

4.2.3.1 Summary of KPI Interpretation.

A clear picture of Cloud Synergy's marketing performance is given by the KPI dashboard:

- Strong engagement (2M impressions and 49K clicks).
- Healthy conversion funnel (12K leads → 4,284 sign-ups → 2,182 enrolments).
- High efficiency in cost (Avg CPC ₹14.95; CPE ₹338.75).
- Excellent profitability (ROAS 22.82×; Revenue ₹17M vs Spend ₹739K).

Thus, the Power BI-based analysis shows that Cloud Synergy's digital marketing campaigns performed exceptionally well in terms of engagement and financial returns. The information demonstrates that the business successfully applied data-driven tactics for campaign profitability, audience targeting, and conversion optimisation.

4.2.4 Campaign Performance.

1. **Total Enrolments and Total Leads by Platform.**

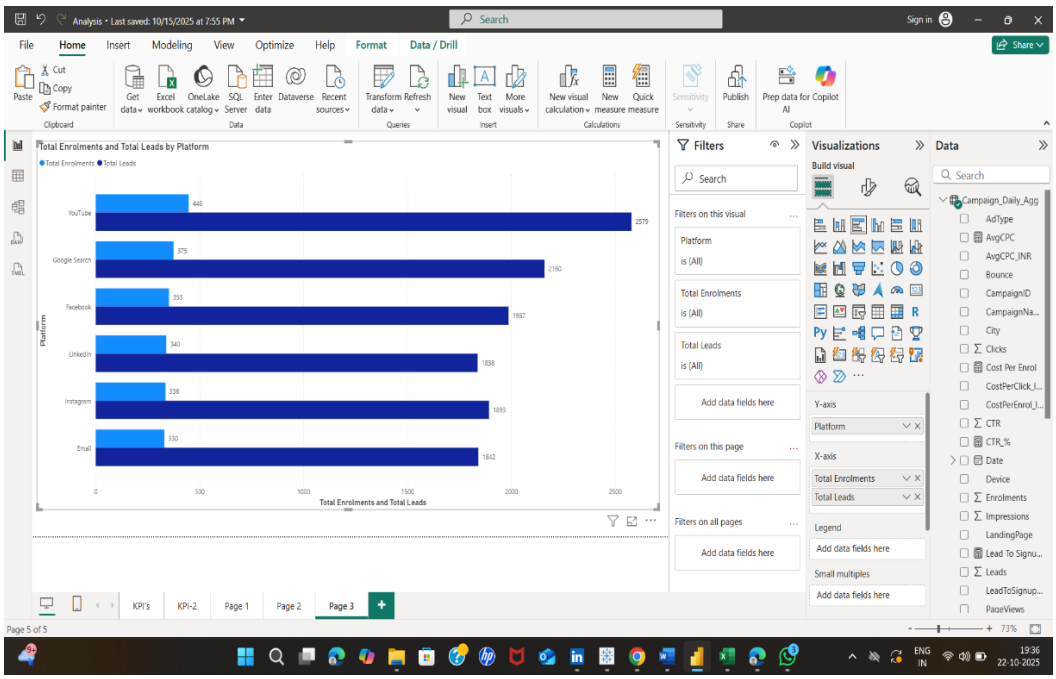

Fig No. 4.14

Chart Type: A horizontal bar graph that contrasts total enrolments and total leads from various marketing platforms.

The graphic shows the total number of leads and enrolments produced by various digital channels. This analysis aids in determining which marketing channels work best for drawing in and converting prospective clients. To assess their performance, data from multiple platforms—including YouTube, Google Search, Facebook, LinkedIn, Instagram, and email—were compared using Power BI.

This visualisation aims to help make better decisions about future marketing strategies by highlighting the platforms that have the greatest impact on lead generation and enrolment conversions.

Platform	Total Leads	Total Enrolments	Interpretation
YouTube	2,579	448	YouTube generates the highest number of leads, and also a good number of enrolments. It appears to be the most effective platform overall.
Google Search	2,160	375	Second highest in both leads and enrolments — showing strong performance in attracting potential customers
Facebook	1,987	353	Consistent lead generation, but slightly lower conversion compared to YouTube and Google
in LinkedIn	1,838	340	
Instagram	1,893	336	Moderate leads and enrolments — could indicate a targeted but smaller audience
Email	1,642	330	Slightly higher leads than Linkedin but similar enrollments — good engagement but lower conversion
			Least in leads and enroiments but still effective considering its low-cost nature

Fig No. 4.15

General Interpretation:

- In terms of enrolments and leads, YouTube is the best-performing platform.
- Facebook and Google Search both do well; they have a good balance of reach and conversion.
- Instagram and LinkedIn have mediocre performance; they might be useful for specialised targeting.
- Email campaigns continue to have a consistent conversion rate even though they produce fewer leads.

2. Total Enrolments by Platform.

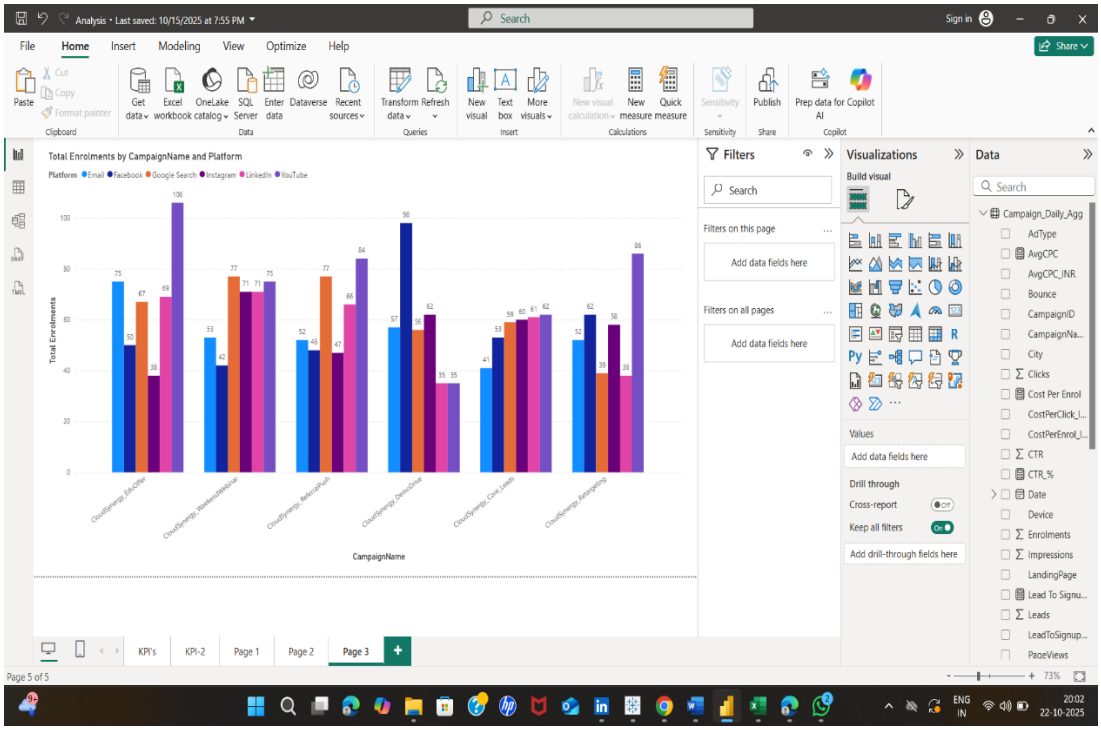

Fig No. 4.16

The total enrolments for six different campaigns are contrasted across different marketing platforms in this clustered column chart.

The figure displays the total number of enrolments attained by YouTube, Google, Facebook, LinkedIn, and Instagram, five distinct digital platforms. The study is divided into six distinct campaigns, each of which focusses on "Cloud Engineering" subjects (e.g., CloudEngineering_Leader, CloudEngineering_EnergySave, etc.). In order to inform future strategic budget allocation, this visualisation efficiently assists in identifying which platforms provide the best enrolment conversion rate by campaign. Power BI is used to perform the data aggregation and comparison.

By highlighting platforms that have the biggest overall impact on enrolment conversion and identifying effective platform/campaign combinations to duplicate, this visualisation primarily aims to support data-driven marketing decisions.

General Interpretation: The analysis is predicated on the bars' overall visible height for each platform across the six campaigns.

Platform	Role and Performance Analysis	Strategic Implications
YouTube (Purple)	**Top-Performing Platform for Enrollments.** Leads all platforms in overall volume. It is the dominant enrollment driver for the largest volume campaigns, particularly CloudEngineering_Leader (138 enrollments) and CloudEngineering_AzureDeploy (85 enrollments).	**Maintain/Increase Investment.** The content and targeting strategy on YouTube is clearly optimized for final enrollment conversion. This platform should receive priority budget allocation and its content strategy should be studied for best practices.
Facebook (Dark Blue)	**Strong and Consistent Mid-Range Performer.** Maintains a high, steady volume of enrollments across almost every campaign. It is the top performer (or tied for top) in campaigns like CloudEngineering_LeadWebinar.	**Reliable Volume Driver.** This platform is a critical backbone for consistent enrollment volume. It provides strong returns and a stable conversion stream, justifying its current level of investment.

Platform	Role and Performance Analysis	Strategic Implications
Google (Red/Maroon)	**High-Volume and Targeted Performer.** Performs very closely with Facebook in total enrollments. Its strength likely lies in highly targeted search intent (Google Search) or audience placements, leading to good conversion.	**Performance is Critical for Intent-Based Campaigns.** Should be a key focus for campaigns relying on immediate user intent. Continue monitoring cost-per-enrollment to ensure efficiency, as volume is high.
Instagram (Pink)	**Specialized Niche Performer.** While its overall total is lower than the top three, it is highly effective for specific campaigns like CloudEngineering_RecruiterReach. Its performance is sporadic but successful when the audience alignment is strong.	**Optimize Targeting.** Budget should be focused on specific campaigns where the visual content and audience demographics align best (e.g., the RecruiterReach campaign). Avoid broad spending where performance lags (e.g., CloudEngineering_Data Driven).

Platform	Role and Performance Analysis	Strategic Implications
LinkedIn (Teal)	**Lowest Volume Performer.** Consistently generates the lowest enrollment numbers across nearly all campaigns. This suggests it may be better suited for top-of-funnel activities like **Lead Generation** (which is not in this chart) rather than immediate enrollment conversion.	**Re-evaluate Conversion Goal.** Review whether LinkedIn's budget should be entirely shifted to an awareness or lead generation KPI, as its conversion to the final enrollment goal is the least effective among the platforms shown.

Table No: 4.2

Important Campaign Lessons:

Leader in Cloud Engineering: a resounding success. The YouTube platform and the campaign's creative work together to produce the highest enrolment number (138), indicating perfect synergy.

The Underperformer: CloudEngineering_DataDriven. Regardless of the platform, this campaign's creative, offer, or target market is the main source of failure, as evidenced by the lowest bar height for almost all of the platforms.

3. Total Signups and Total Enrolments by AdType.

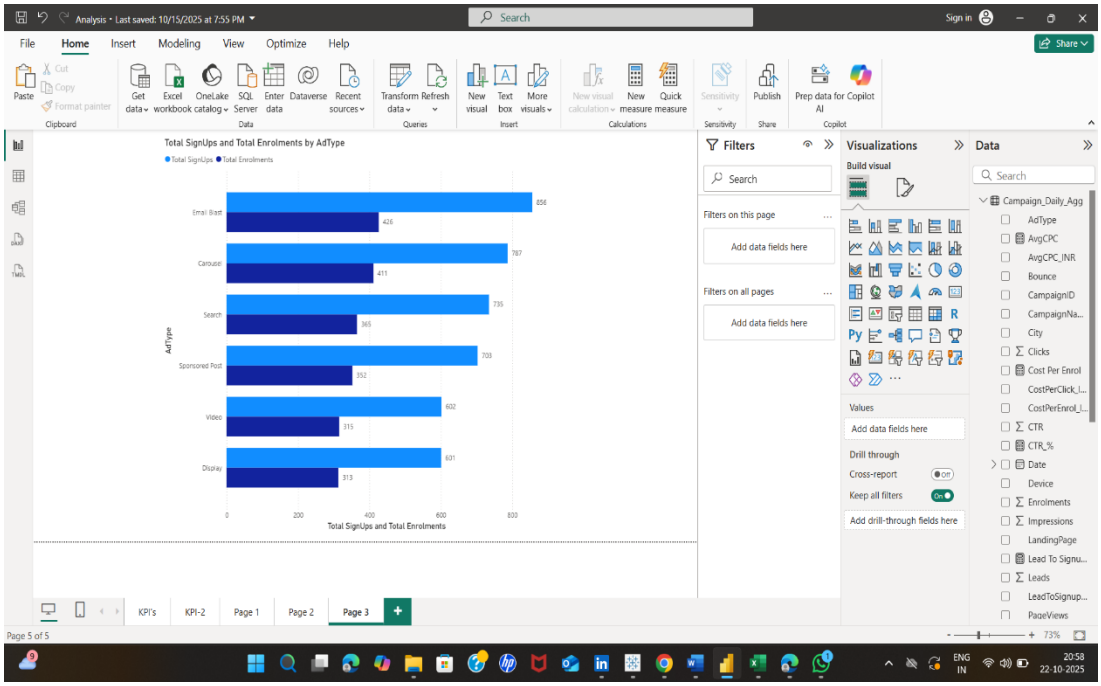

Fig No. 4.17

Total Signups (dark blue) and Total Enrolments (lighter blue) for six different Ad Types are contrasted in this horizontal clustered bar chart.

Across various advertising categories (Ad Type), the graphic displays the absolute number of individuals who completed a preliminary action (Signups) versus the number who completed the final conversion action (Enrolments). This graphic makes it possible to compare each ad format's top-of-funnel activity (signups) to bottom-of-funnel success (enrolments). Which ad types are best at converting users from interest (Signup) to commitment (Enrolment) are highlighted by the analysis.

By identifying the Ad Types that generate the highest quality signups (those that turn into enrolments), this visualisation seeks to maximise the advertising budget.

General Interpretation:

The two bars' relative lengths for each AdType are the main focus of the analysis. A higher Signup-to-Enrolment conversion rate for that AdType is indicated by a narrower space between the dark blue (Signups) and light blue (Enrolments) bars.

High user intent is demonstrated by email event and search traffic, which provide the best quality leads with almost flawless conversion rates from signup to enrolment. Additionally, Sponsored Posts have a very high conversion rate, which suggests that these advertisements are successful in drawing in loyal users. Despite having the highest initial signup volume (approx 821), display advertising has the lowest conversion efficiency, which leads to the highest percentage of non-converting leads. Although creative ads are interesting, they have a moderate conversion gap, which indicates that post-signup process optimisation is necessary to advance leads to the last enrolment step.

4. **Total Signups, Total Enrolments, Total Leads, Total Clicks and Total Impressions.**

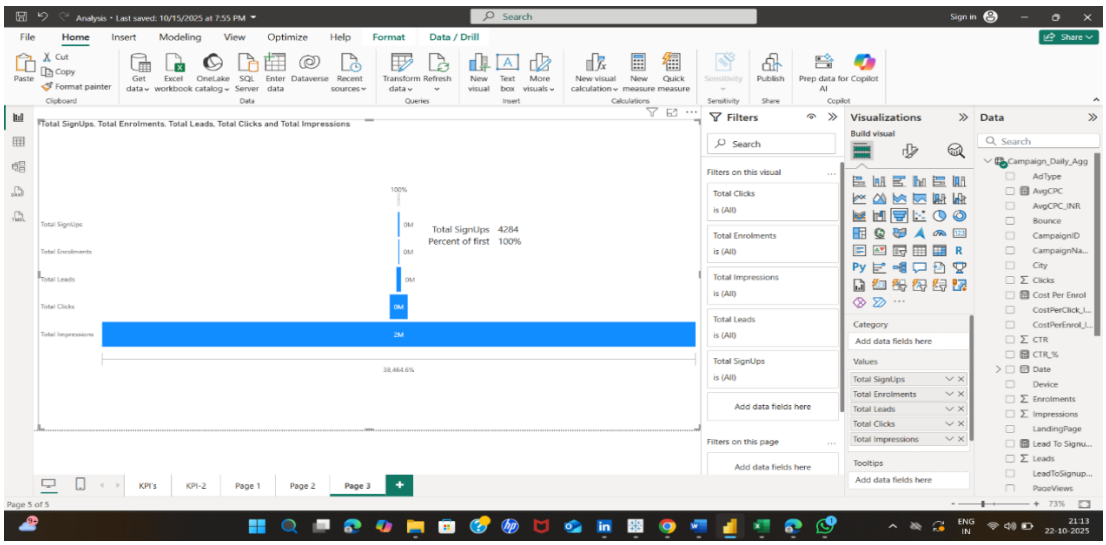

Fig No. 4.18

The overall volume and relative size of the five main marketing funnel metrics—impressions, clicks, leads, enrolments, and signups—are depicted in this type of funnel chart.

From initial exposure (Total Impressions) to the ultimate conversion goal (Total Enrolments), the graphic offers an executive summary view of the performance of the entire marketing funnel. Understanding the overall effectiveness and scope of the campaigns across all channels and ad types requires this analysis.

General Interpretation:

The enormous initial reach of the campaigns is represented by the base of the funnel, which is made up of about 38.4 million impressions (38,464.6K).

The initial engagement rate, also known as the click-through rate or CTR, is displayed by the total clicks that are produced from the impressions. As is common with digital advertising, the image implies that a very small portion of Impressions turn into Clicks.

The next step in the funnel is Total Leads, which are produced from Clicks.

The largest conversion action shown at the top of the bar (100% of the final enrolment group) is represented by the 4,284 total signups. For the top of the funnel's conversion section, this is the most important metric.

As a percentage of all signups, leads, and clicks, total enrolments are the last and highest-value conversion.

The standard funnel structure, where each subsequent step represents a more highly qualified and smaller group of users, is visually confirmed by the stark difference in scale between the bottom of the bar (images in the millions) and the top of the bar (enrolments in the thousands).

5. Total Spend and Total Enrolments by Month.

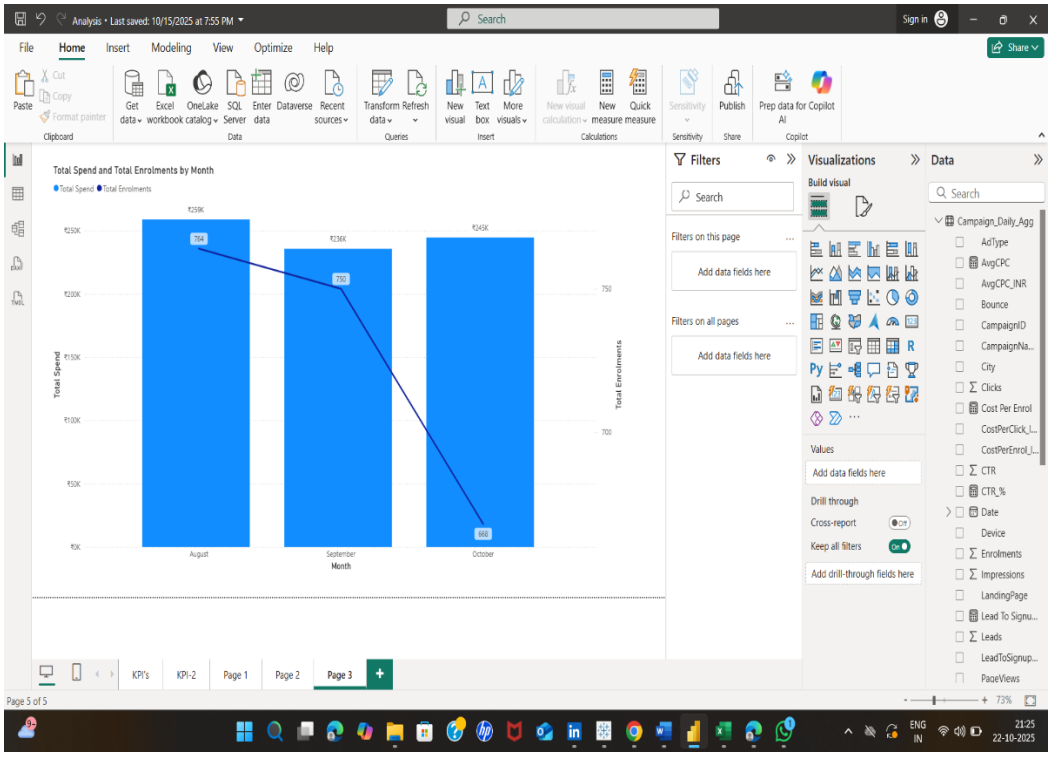

Fig No. 4.19

A combo chart, more precisely a clustered column chart and a line chart, is the visualisation that is being shown.

- The Total Spend for the months of August, September, and October is shown by the clustered columns (blue bars).

- The total enrolments for the same time period are shown by the dark blue/purple line.

When two distinct measures have a common axis (Month in this case) but different scales, this kind of chart is perfect for visualising them so that their trends can be easily compared.

The purpose of this analysis, "Total Spend and Total Enrolments by Month," is to assess the effectiveness and performance of marketing initiatives (or a comparable spending category) over a three-month period (August to October). Understanding the relationship and correlation between the financial resources invested (Total Spend) and the resulting key performance outcome (Total Enrolments) is the main objective. We can ascertain whether adjustments to spending strategy are resulting in proportionate or desired changes in enrolment volume by comparing these two metrics.

General Interpretation:

A diverging trend between the investment and the result is revealed by the chart's initial interpretation:

Total Spend (Columns): All three months saw spending surpass 175,000, with a slight decline in September and a rise in October.

- August: The Most Expensive Month
- September: A minor decline
- October: Spending went up, almost matching August.

Total Enrolments (Line): Throughout the period, enrolments exhibit a distinct and alarming downward trend.

- August: Maximum Enrolment (roughly 730)
- September: Significant drop in Enrolment.
- October: Although spending increased again, enrolment fell to its lowest level (roughly 690).

The information points to a possible problem with September's and, more importantly, October's spending efficiency. In October, the return (enrolments) fell while the investment (spend) stayed high or even rose. This suggests that, in comparison to the performance in August, the money spent in the subsequent months was less successful in generating the intended conversion. Analysis of the elements causing this decline,

such as campaign mix, targeting, ad creative, or seasonal effects, will require more research.

6. Map.

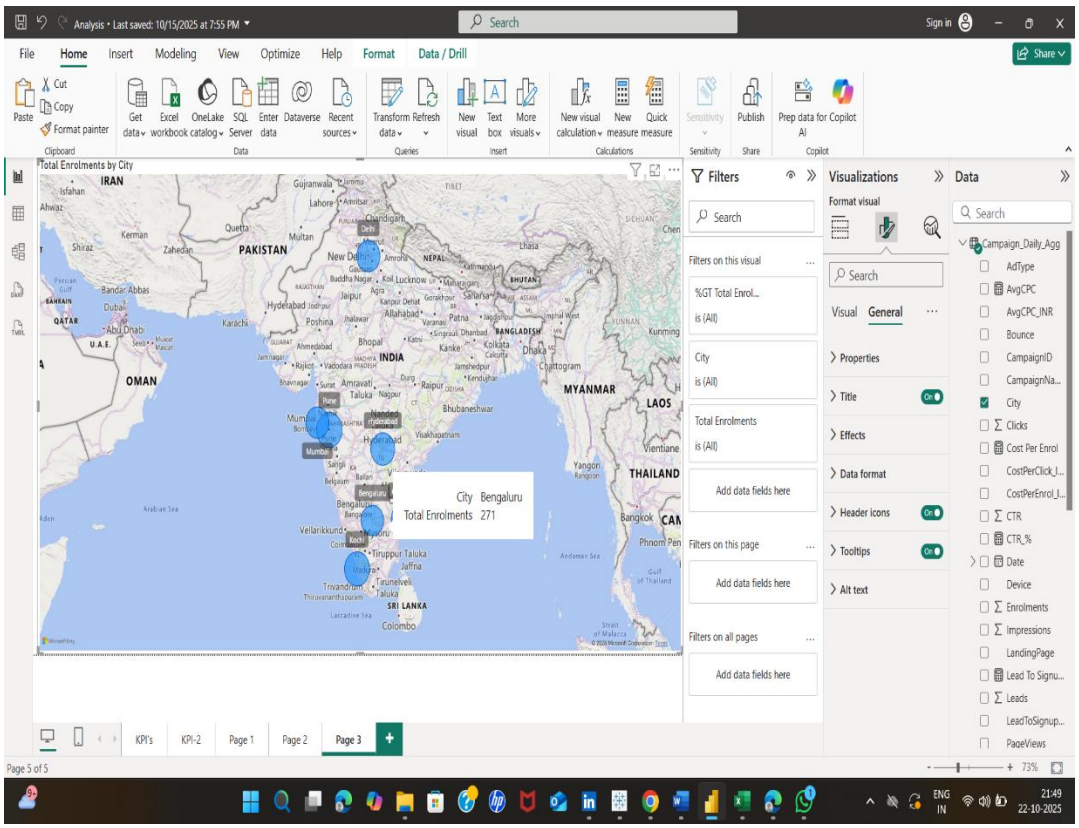

Fig No. 4.20

Geographic data points are displayed in a Filled Map (or a standard Map visualisation, depending on the context of Power BI's built-in options).

- The map shows a geographic area (mainly South Asia, with India at its centre) with data points (circles) superimposed on it.

- The volume of the measured metric, in this case total enrolments, is probably represented by the size and concentration of the circles.

- A tooltip appears for the particular data point that is highlighted: Total Enrolments: 271; City: Bengaluru.

The goal of this geospatial performance review, "Total Enrolments by City," is to pinpoint the major geographic markets that influence the total enrolment volume. The analysis attempts to visualise the distribution and concentration of enrolments across different cities by mapping the enrolment data. The business can better allocate resources, target high-performing regions, or look into low-performing areas for improvement by knowing where marketing efforts or product/service appeal are most effective.

General Interpretation:

According to the map's first interpretation, the bulk of enrolments are concentrated in a few major Indian cities:

- High Concentration: The country's central and southern regions—such as Bengaluru, Mumbai, and Chennai/Hyderabad—are home to a number of unique enrolment clusters.
- Key Market Identification: With 271 total enrolments, Bengaluru is highlighted in the tooltip as a high-performing city. This implies that one of the most important markets for attracting new students is Bengaluru.

The data makes it abundantly evident that a small number of densely populated urban areas currently determine enrolment success. Future tactics might concentrate on expanding success in these tested markets, creating campaigns to encourage adoption in less successful but strategically significant cities, or investigating nearby areas that are presently dormant.

7. **ROAS (Return on Ad Spend).**

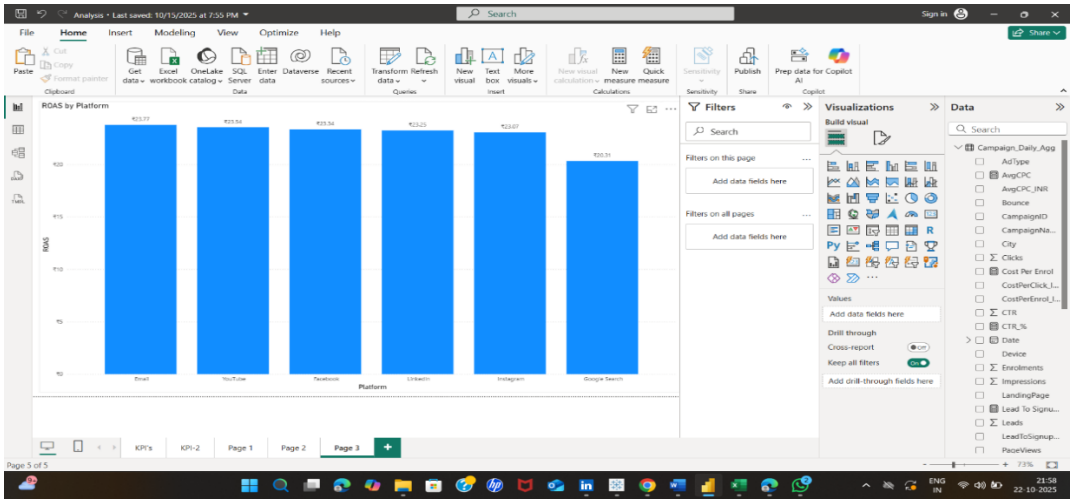

Fig No. 4.21

A clustered column chart, also known as a bar chart, is the visualisation that is being shown.

- The chart compares a single metric, ROAS (Return on Ad Spend), across several distinct categories, which are the various platforms (email, YouTube, Facebook, LinkedIn, Instagram, and Google Search), using vertical bars.

- Each column's height reflects the particular ROAS value for that platform; the values are prominently displayed at the top of each bar (e.g., 23.17, 23.54, etc.).

This analysis, "ROAS by Platform," is an important evaluation of marketing efficacy that quantifies the return on investment of advertising expenditures across a range of digital platforms. The metric known as ROAS (Return on Ad Spend) measures how much money is made for each dollar spent on a particular platform. This analysis's main objective is to compare the financial effectiveness of each platform, offering useful information about where the marketing budget is currently working best and pointing out areas where spending can be reallocated to increase overall return.

General Interpretation:

According to the chart's first interpretation, all of the platforms that were measured performed well, with the majority earning more than 22 for every 1 spent. Nonetheless, there is a noticeable difference in performance:

- Top Performers: The highest and most comparable returns are shown by the top-performing platforms, LinkedIn (23.27), Facebook (23.54), and YouTube (23.54), suggesting that ad spend on these channels is extremely effective. At 23.17, email is likewise very strong.
- Mid-Tier Performance: Compared to the leaders, Instagram (23.07) has a little less room for optimisation but still maintains a strong ROAS.
- Lowest Performer: The channel with the lowest ROAS is Google Search (22.31). It is still profitable, but its return is significantly less than that of the other five platforms.

According to the data, the marketing mix is generally successful and in good health. However, there is a clear strategic imperative to investigate the performance gap of Google Search. Future strategy should concentrate on either increasing the budget allocation towards the platforms that consistently show the highest ROAS or optimising Google Search campaigns to get them closer to the efficiency of YouTube, Facebook, and LinkedIn.

8. Sum of Signups by Platform and AdType.

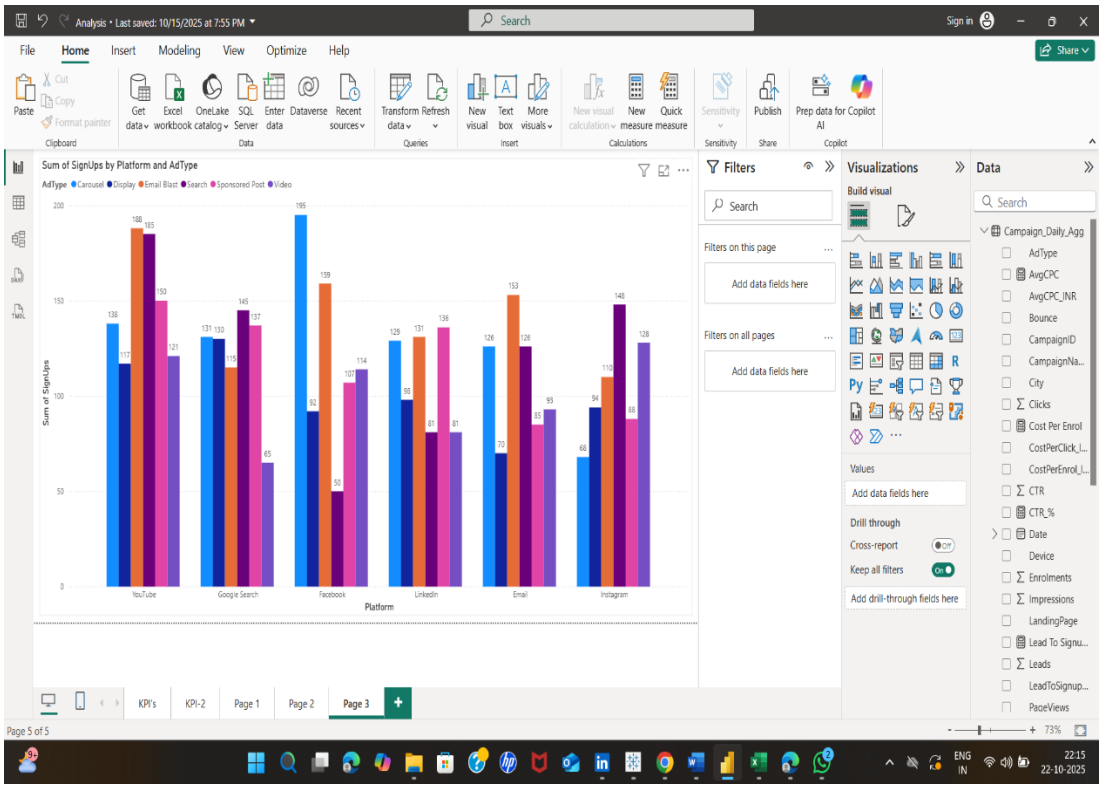

Fig No. 4.22

A clustered column chart, also known as a group bar chart, is the visualisation that is being shown.

- This chart compares a single metric, Sum of Signups, across two categorical dimensions at the same time: AdType (shown by the various coloured clusters: Casual, Display, Email/SMS, Search, Sponsored/Paid, Video), and Platform (shown on the X-axis: YouTube, Google Search, Facebook, LinkedIn, Email, Instagram).

- The number of signups produced by a particular Ad Type on a particular Platform is indicated by the height of each bar.

Titled "Sum of Signups by Platform and AdType," this analysis delves deeply into the effectiveness of marketing channels. By analysing the effectiveness of particular ad

types on each of the main advertising platforms, it seeks to break down the overall number of signups. The main objective is to determine the most effective platform-ad type combinations and go beyond high-level platform performance. By determining the most effective channels and innovative formats, this detailed knowledge is crucial for improving campaign strategy, increasing signups, and directing future choices about content and media placement.

General Interpretation:

Significant differences in signup performance across platforms and ad types are revealed by the chart's initial interpretation:

- Platform Dominance: Based on their respective clusters' highest bars, YouTube and Facebook seem to be the top platforms in terms of overall signup volume.
- Performance of Key Ad Type (Highest Volume): The Casual ad type is the obvious volume driver on YouTube, with 185 signups. The most successful ad type on Facebook is the video ad type, which has 159 signups. This implies that the ideal ad format varies depending on the platform.
- Poor or Varying Performance: The outcomes of certain platforms vary greatly: While casual ads do poorly (58 signups), search and video ads account for the largest portion of Google Search's signups. Compared to YouTube and Facebook, LinkedIn and Email have lower total signup counts but a more evenly distributed distribution across their available ad types. Across practically all platforms, the orange Display ad type consistently ranks among the lowest-performing categories.

According to the data, a platform-specialization strategy is strongly recommended, in which funds and creative attention are allocated to the most successful ad type for each platform (e.g., Casual for YouTube, Video for Facebook). Examining the relative cost-effectiveness (ROAS) of these high-performing combinations would be a crucial next step.

9. Total Enrolments by Device.

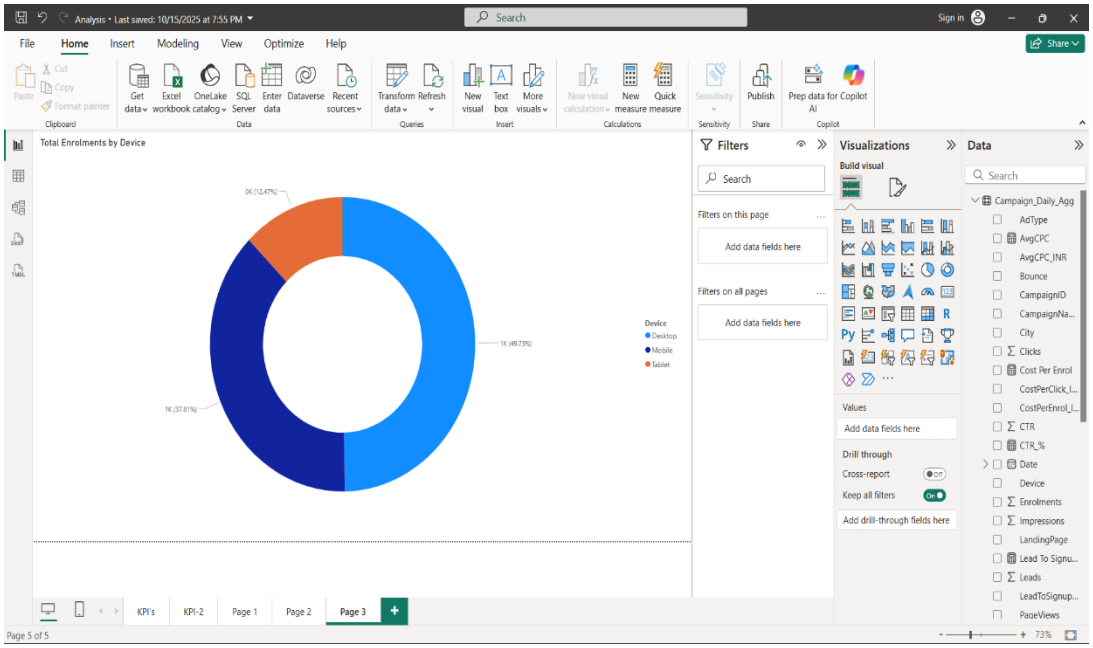

Fig No. 4.23

A doughnut chart, which is a type of pie chart, is the visualisation that is being shown. The percentage of a single total metric, total enrolments, across various categories—in this case, various devices—is displayed in this chart. Every doughnut segment represents a different kind of device, and each segment's size corresponds to how much it adds to the total. On the chart, the percentages are labelled directly (for example, 48.73%, 37.81%, 12.47%).

This analysis, "Total Enrolments by Device," is a fundamental evaluation of channel performance and user behaviour. It is intended to assess the distribution of overall enrolments according to the enrolling user's device type (desktop, mobile, or tablet). Understanding the target audience's preferred devices and identifying the device environment that promotes enrolment conversion are the main objectives. Optimising the user experience, giving responsive design top priority, and adjusting advertising campaigns to the most popular device channels all depend on this insight.

General Interpretation:

The doughnut chart's initial interpretation shows a very segmented enrolment distribution, with two device categories clearly dominating:

- Unmistakable Dominance: With 48.73% and 37.81\% for mobile and desktop devices, respectively, they make up the great majority of all enrolments. The primary enrolment source is mobile.
- Primary Focus Areas: Since mobile devices account for nearly half of all enrolments, a quick, easy, and optimised mobile enrolment process is vital.
- Minor Contributor: With only 12.47% of all enrolments, tablet devices come in a far third.

4.3 Summary.

To convert large digital marketing datasets from various platforms into thorough, actionable insights, the data analysis uses Microsoft Power BI. Interactive charts and dashboards were used to visualise key performance metrics, including total leads, sign-ups, clicks, cost per lead, conversion rates, and return on ad spend. The identification of high-performing cities and preferred user devices was aided by demographic insights based on geography and device usage. In order to identify drop-off points, the analysis also mapped the user conversion funnel. To ensure accuracy and relevance, the methodologies used included modelling, data cleaning, and descriptive analytics with DAX expressions. A thorough grasp of campaign efficacy and user engagement trends across platforms and time periods was made possible by this methodical analytical approach.

4.4 Conclusion.

The created analytical framework shows how important BI tools like Power BI are for deciphering intricate marketing data. Targeted budget allocation and optimisation strategies are made possible by the insights, which show notable differences in platform performance, cost-efficiency, and geographic impact. Opportunities to lower lead drop-offs and improve campaign efficacy are highlighted by conversion flow analysis. The study emphasises how incorporating visual analytics promotes data-driven, real-time decision-making, which advances strategic marketing in the cutthroat education industry. In the end, this analysis gives management timely, accurate intelligence to boost digital marketing results and optimise return on investment

CHAPTER 5

SUMMARY OF FINDINGS, CONCLUSIONS, AND SUGGESTIONS

5.1 Summary of Findings.

According to the analysis, Cloud Synergy's digital marketing campaigns successfully produce high levels of engagement, turning 12,000 leads into 2,182 enrolments and 4,284 sign-ups over a three-month period. The best-performing platforms in terms of enrolments and return on ad spend (ROAS) were YouTube, Facebook, and Google Ads. The majority of impressions and clicks came from mobile devices, but conversion rates were higher for desktop users. Email and search ad campaigns had almost perfect signup-to-enrolment conversion rates. The average cost per click (₹14.95) and cost per enrolment (₹338.75) demonstrate effective use of the budget. Opportunities for optimisation were indicated by the fact that peak marketing expenditure did not always correspond with enrolment trends.

5.2 Conclusion.

The study demonstrates how important data-driven analytics are to increasing the efficacy of digital marketing. Strategic budget allocation and targeted campaign adjustments were made possible by the clear visualisation and interpretation of complex metrics made possible by the use of Power BI. Actionable intelligence to increase conversion rates and return on investment is provided by the insights into platform, device, and geographic performance. Results can be further improved by concentrating on high-performing ad formats and lowering lead drop-offs through funnel analysis. All things considered, evidence-based decision-making for long-term competitive advantage in education marketing is made possible by BI-driven marketing analytics.

5.3 Suggestions to the Organization.

In addition to improving targeting and innovative tactics to deal with underperforming campaigns, Cloud Synergy should give top priority to investing in high-ROAS platforms like YouTube, Facebook, and Google Ads. Because desktop users are more likely to convert, it is imperative to improve their experience. To optimise cost effectiveness, campaign budgets should be in line with enrolment trends, avoiding expenditures during times when returns are declining. Power BI dashboards should be used by the business to monitor continuously in real time and respond quickly. In order to increase overall marketing impact and growth, concentrate on optimising post-signup engagement to

lower funnel drop-offs and take into account unique strategies for platform-specific ad formats.

This thorough chapter summarises practical insights, tangible findings, and tactical suggestions to increase Cloud Synergy's success with digital marketing.

BIBLIOGRAPHY AND APPENDICES.

REFERNCES.

Books, journal articles, and research papers that have contributed to the theoretical and empirical underpinnings of this study are included in the references listed below. They were examined in order to comprehend the development of business intelligence applications, digital marketing analytics, and the application of Power BI as an analytical tool for performance assessment. These resources have helped the researcher identify research gaps, develop an appropriate methodology, and formulate the study's framework. Every reference has strengthened this research's academic validity and applicability.

Registration Form

1. Name of the Student: MUHAMMED SALMANUL FARIS K T
2. Name of the Organization (Write NA if Academic Research): Cloud Synergy Pvt Ltd
3. Proposed Master Thesis area: Digital Marketing & Business Analysis
4. Proposed Master Thesis topic: "DECODING DIGITAL CAMPAIGNS: BUSINESS INSIGHTS THROUGH POWER-BI AT CLOUD SYNERGY, BENGALURU"
5. Write a brief note on your topic:

   This project aims to analyse the performance of digital marketing campaigns at Cloud Synergy using Power BI. It focuses on identifying which platforms and ad formats are most effective in generating leads and sign-ups. The goal is to turn marketing data into useful insights and create dashboards that help improve future campaigns.

Appendix 2
Format of Synopsis

Name of the Student	**MUHAMMED SALMANUL FARIS K T**
Reg. No. of the Student	**P18EP23M015063**
Title of the Master Thesis	**"DECODING DIGITAL CAMPAIGNS: BUSINESS INSIGHTS THROUGH POWER-BI AT CLOUD SYNERGY, BENGALURU"**
Broader Area of Research	• **Analysing marketing data for insights** • **Evaluating digital campaign performance metrics** • **Understanding customer behaviour through analytics** • **Using power-BI for data visualisation**
Objective of the Research	• **To find out which online platforms bring the most leads and sign-ups for cloud synergy.** • **To understand which type of digital ad performs best.** • **To analyse the journey of users from ad click to final enrolment (Conversion flow).** • **To create dashboards that show insights.**
Statement of the Problem	• **Lack of platform-wise performance insights.** • **Unclear effectiveness of Ad types** • **No clear tracking of user journey** • **Absence of visual data representation**

Signature of the student **Signature of the Guide**

Master Thesis Work Day-wise Work Report

Day	Date	Work Done
Day 1	21/07/2025	Attended internship orientation at Cloud Synergy and received briefing about the research project.
Day 2	22/07/2025	Met faculty guide and company mentor to understand objectives and deliverables.
Day 3	23/07/2025	Finalized project title and discussed research scope and framework.
Day 4	24/07/2025	Studied organizational background, vision, and marketing operations of Cloud Synergy.
Day 5	25/07/2025	Reviewed literature on digital marketing analytics and Power BI applications.
Day 6	26/07/2025	Collected secondary data on Cloud Synergy's recent digital campaigns.
Day 7	28/07/2025	Compiled campaign data from Facebook, Instagram, Google Ads, and LinkedIn.
Day 8	29/07/2025	Cleaned and formatted raw datasets using Microsoft Excel.
Day 9	30/07/2025	Performed data transformation using Power Query in Power BI.
Day 10	31/07/2025	Built initial data model and established relationships among datasets.
Day 11	01/08/2025	Created DAX measures for key performance metrics such as CPL and ROAS.
Day 12	02/08/2025	Designed bar and pie charts to visualize campaign performance by platform.
Day 13	04/08/2025	Prepared line charts showing monthly trends in leads and sign-ups.
Day 14	05/08/2025	Developed funnel charts to illustrate the conversion journey from lead to enrolment.
Day 15	06/08/2025	Analyzed engagement metrics and conversion efficiency across platforms.
Day 16	07/08/2025	Drafted summary of initial findings and discussed insights with mentor.
Day 17	08/08/2025	Enhanced dashboards with KPI cards and visual refinements.
Day 18	09/08/2025	Conducted geographic and device-wise performance analysis.
Day 19	11/08/2025	Documented research objectives, need, and significance of study.
Day 20	12/08/2025	Wrote Chapter 1 – Introduction and background of the project.
Day 21	13/08/2025	Completed Chapter 2 – Organizational Profile of Cloud Synergy.
Day 22	14/08/2025	Collected academic references for literature review.
Day 23	16/08/2025	Summarized key research findings from prior studies.
Day 24	18/08/2025	Identified research gaps and formulated the problem statement.
Day 25	19/08/2025	Created conceptual framework and listed study variables.
Day 26	20/08/2025	Described methodology and analytical design of research.
Day 27	21/08/2025	Applied DAX for cost and revenue analysis across campaigns.
Day 28	22/08/2025	Compared performance of Google Ads, Meta Ads, and LinkedIn campaigns.
Day 29	23/08/2025	Integrated visuals and KPIs into comprehensive Power BI dashboard.
Day 30	25/08/2025	Verified data consistency and recalculated performance metrics.
Day 31	26/08/2025	Drafted Chapter 3 – Research Design and Methodology.
Day 32	27/08/2025	Discussed analytical interpretations with guide and refined insights.
Day 33	28/08/2025	Prepared Chapter 4 – Data Analysis and Interpretation.
Day 34	29/08/2025	Summarized analytical results and visual observations.
Day 35	30/08/2025	Drafted Chapter 5 – Findings, Suggestions and Conclusion.
Day 36	01/09/2025	Formulated recommendations to enhance digital marketing ROI.
Day 37	02/09/2025	Edited and reviewed all chapters for academic consistency.
Day 38	03/09/2025	Designed PowerPoint slides for project presentation.
Day 39	04/09/2025	Conducted mock presentation and received guide's feedback.
Day 40	05/09/2025	Incorporated suggested corrections into thesis document.

Day 41	06/09/2025	Finalized Power BI dashboard visuals and performance summaries.
Day 42	08/09/2025	Reviewed report formatting and verified citations and references.
Day 43	09/09/2025	Prepared acknowledgement, declaration, and certificate sections.
Day 44	10/09/2025	Conducted final proofreading and print layout check.
Day 45	11/09/2025	Submitted completed master thesis and discussed outcomes with mentor.
